

Coal cars are pulled over the hopper, as shown at right, and the coal is dumped into the track hopper where it is fed to feeder Number 1. The feeder carries the coal to the crusher, after which it goes to a belt conveyor that carries the crushed coal to the top of the Boiler House. The part of the belt conveyor that is above ground is shown at left. Coal from the yard area is fed to the crusher by feeder Number 2.

At left is shown the coal conveyor in the tunnel as it carries the crushed coal from the crusher to the Boiler House. Above is the conveyor and walkway from the Transfer House to the top of the Boiler House. This photo was taken from the Boiler House roof looking downward. The conveyors and walkways rise at an angle of about 17 degrees with the ground.
