Miss McCain To Go To Indonesia

Greensboro, N. C., April 27—Miss Madeleine McCain, assistant professor of health at Woman's College, has received an appointment in the secretariat of the World Health Organization. She will be on a two-year assignment as Health Education Advisor to the Ministry of Health of the Indonesian Government and will be stationed in Jakarta, Indonesia. Miss McCain was employed a number of years with the District Health Department here, and with Appalachian State Teachers College. Miss McCain has been granted a leave of absence from WC and will fly to Geneva, Switzerland, on June 15 for an orientation period at the WHO office there. During this period she will be provided with material on the project and will be given background information on Indonesia. To Act As Advisor Miss McCain's responsibilities in Indonesia will center around advising and assisting the government in developing and expanding their health education program. Miss McCain has been on the faculty of WC since September 1953. She received her A. B. from East Carolina College and received her master's in public health from the School of Public Health at the University of North Carolina. Miss McCain is a fellow of the American Public Health Association and the Society of Public Health Educators. She is a native of Waxhaw.

Witchweed New Farm Parasite

North Carolina State College and the U. S. Department of Agriculture are looking to farmers for help in locating and stamping out any new infestations of witchweed—a destructive parasite of corn, sorghum and other plants, mostly grasses which grow in the summer. Drs. Glenn Klingman and Richard R. Nelson of State College describe witchweed as a harmless looking plant usually about eight inches high with small orange-red flowers and slightly hairy leaves. Found last year in several counties of both North and South Carolina, this is believed to be the first time it has invaded the Western Hemisphere. But the highly destructive weed pest can easily be spread by means of its tiny seeds (roughly 1-20 to 1-15 the size of tobacco seed). The seeds have the ability to remain dormant but alive for a number of years, according to the two scientists. One plant can produce up to half a million seed. Witchweed attaches itself to the roots of susceptible plants, reducing and stunting their growth. Affected plants appear to be suffering from severe drought—they are stunted, yellowish and wilted. Corn yields in some infested fields in the Carolinas last year were complete failures. Here are some suggestions from State College and the USDA about how to prevent witchweed from spreading to new areas: Look for a weed that answers the description of witchweed, especially if corn, sorghum or Sumner grasses show unexplainable stunting. The weed would be growing very close to affected plants. Get in touch with your county agricultural agent if you think you have found witchweed growing in your vicinity. He can arrange for positive identification and can suggest measures for control. Do not move witchweed plants or seed from your field, since by doing so you could easily spread the pest. As a preventive measure, do not bring or ship hay, nursery plants, bulbs or root crops from an infested area. Even farm machinery or equipment, or used boxes and crates can carry the tiny seeds. Such equipment should be thoroughly cleaned before used if brought from an area in which witchweed is growing. Up to this time, witchweed has been found only in Bladen, Columbus, Cumberland, and Robeson Counties in North Carolina, and Dillon, Horry, Marion, and Marlboro Counties in South Carolina. The pest was identified last summer by Howard R. Garris, in charge of plant pathology for the N. C. Agricultural Extension Service. It has been associated principally with soils containing large amounts of sand. Agricultural scientists are hard at work trying to find out just what plants witchweed attacks and the conditions which favor its growth. The N. C. Agricultural Experiment Station at State College has a total of seven acres rented near Evergreen, in Columbus County, in which it is cooperating with the USDA in witchweed research. The college also has another witchweed research program under way near Red Springs.
