WORLD'S MOST PREVALENT DISEASE

What is the world's most prevalent disease? If your answer is the common cold - you're wrong! Tooth decay is the most universal disease in the world. Only a minute fraction of the world's people are free of it. Only 2 per cent of the American population has been spared. Earliest cavities show up right after primary teeth erupt. The average 13-year-old already has at least five cavities in permanent teeth. Girls seem to get more cavities than boys; but then, girls get their teeth sooner. A cavity is a hole in a tooth caused by decay which is produced by the combination of plaque and acid. It doesn't take a few days for trouble to develop. Tooth decay can start in less than 15 minutes after eating. All that is needed are three ingredients; a tooth, bacteria (in dental plaque) and sugar. When the bacteria and sugar meet, acid is formed. When the acid and tooth meet, the acid starts etching a hole in the tooth. Today's diets, high in refined sugars and carbohydrates, are conducive to decay. But careful and PROMPT oral hygiene procedures after eating will reduce, if not eliminate, the decay-producing activity of the modern diet.
