### You Should Faint At The Sight Of Blood

Bleeding gums are unhealthy gums. The state of the gums reflects the health of the underlying tissues that can't be seen - and bleeding should alert you that more serious problems lie ahead if the condition is left untreated.

Fortunately, gingivitis is a reversible condition. With proper treatment it can be cured and the gums restored to normal health. If you can maintain healthy gums, you can avoid periodontal disease - the major cause of adult tooth loss.

The villain in the case of gingivitis (and periodontal disease) is plaque. It accumulates rapidly and develops under the gums as well as between and on the teeth. Plaque can harden and build up if not removed regularly. This hardened plaque is called tartar or

calculus. At this juncture, only a professional scaling will remove the accumulation under the gum line, which is where these deposits can quickly build and cause tissue damage and probable loss of teeth.

If you observe bleeding from your gums, don't assume that it isn't serious. See your dentist.
