Sunday School 10:00 A.M.
Worship Service 11:00 A.M.
Youth Meeting 6 P.M.
Council on Ministries, 1st Sun. 7 P.M.

Efforts Made To Achieve Hurricane Preparedness

By Bob Cairns
If Beryl and Gilbert were another big one hits, the program is a course within the University of North Carolina System which works through a state and federal partnership to advocate the appropriate development of the nation's coastal areas and oceans, through research, extension and education. Since much of the research in the program is done by NCSU experts, the UNC-Sea Grant Program is head-quartered on the Raleigh campus.

Those names--which sound as though they might belong to a long-lost aunt and uncle from New Jersey--actually have been assigned to 1982 hurricanes, tropical storms which history has shown can hit the North Carolina Coast and destroy everything in their paths.

The week of August 1-7 is Hurricane Awareness Week in North Carolina, and according to John Sanders, a North Carolina State University coastal weather specialist, most North Carolinians need to readjust their thinking about hurricanes.

"The question can't be: Will another storm like Hazel or Donna hit our coast," Sanders said. "We must begin to think in terms of when will the next major hurricane strike?"

Hurricanes are giant whirlwinds in which air moves at speeds up to 200 miles per hour in a large tightening spiral around a center of extreme low pressure--called the eye. As the storm travels, it dominates the ocean surface, causing a swell of water referred to as the "surge."

"The mounds of water can grow to as high as 25 feet, and when they hit land, they often have the power to move everything in their paths," Sanders said. Sanders is working through the UNC-Sea Grant College Program to educate the people of North Carolina about hurricanes in

preparation for the day when another big one hits. Sanders said. "The program is a course within the University of North Carolina System which works through a state and federal partnership to advocate the appropriate development of the nation's coastal areas and oceans, through research, extension and education. Since much of the research in the program is done by NCSU experts, the UNC-Sea Grant Program is head-quartered on the Raleigh campus.

"Technological improvements in radar and aircraft and the development of geostationary satellites have provided excellent tools for the early detection of hurricanes and continuous monitoring of storm motion," Sanders said. But according to the NCSU scientist, technological solutions to the hurricane hazard which have helped to reduce the loss of life may also have provided a false sense of security and encouraged unwise development in coastal areas.

"In the last 20 years many residents, unfamiliar with the forces of a hurricane system, have moved into areas which may be affected by a hurricane storm surge and coastal flooding," Sanders said. "In a recent survey, only about one out of every eight people on the coast were aware of the role which precipitation and storm surge play in causing widespread coastal flooding."

The implications of this lack of knowledge are extremely serious, since nine out of every 10 deaths caused by hurricanes result from drowning. Also, few if any transportation networks in North Carolina's coastal areas are designed for the large traffic volumes which would occur with major evacuation, Sanders said.

"Elevated storm tides and storm-generated waves can pound structures near the beach and inundate large areas of low-lying land. Some coastal roads could be subject to flooding, hours before the center of the hurricane comes on shore," he said.

Part of this effort to achieve hurricane preparedness along the coast, Dr. John R. Stone, an NCSU assistant professor of civil engineering, recently completed a Sea Grant-sponsored project to estimate evacuation times for North Carolina coastal communities.

In this study, using Holden Beach and Goose Creek Island as models, Stone evaluated problems, reviewed methods for determining evacuation times and suggested future directions for developing better planning methods.

"The important outcome of Stone's work has been the development of an evacuation time-line which can be adapted to other coastal communities," Sanders said.

In his Holden Beach model Stone estimates that people should be ordered to leave their homes eight to 13 hours before the time the eye of the storm is predicted to strike land.

His estimates allow three to four hours for mobilization, one-half hour for travel and two to three hours for delays at bridges and busy intersections. Additional time, called cut-off time, must be allowed for getting through on roads blocked by flying-debris and flooding.

"We feel that Stone's findings will be extremely helpful in our efforts to bring other coastal communities to a better state of readiness," Sanders said. "It must be recognized that the best possible forecast and advance warning from the National Hurricane Center, by itself, will not guarantee safety for individuals in the areas vulnerable to storm surge damage and flooding," Sanders said. "Only if people combine this forecast with quick, sensible, and effective response to the storm threat can hurricane-related fatalities be minimized."

Directing Workshop
Lucy Vaughan, drama instructor in the fine arts department at College of The Albemarle, will conduct a Directing Workshop on Aug. 23 and 24 at Martin Community College in Williamston.

The summer workshop series, which address special aspects of theatrical instruction, is sponsored by the Northeastern District of the N.C. Department of Public Instruction. Attendance by public school drama teachers in the district is encouraged by the department.

Farm Report

By Dr. J.W. Pou
The stakes are high in modern farming. And they're getting higher every year.

Can the individual farmer reduce his business risks? The capital investment per farm now exceeds \$300,000. Last year, cash operating expenses averaged \$56,000 per farm in the United States according to Bill Humphries, Agricultural Communications Specialist at N.C. State University.

The individual farm operator's net returns for the year are determined by countless forces, most of which he cannot control. Among these forces are the weather, insect and disease attacks, contamination of crops or livestock feed, fuel shortages, strikes at machinery plants or in the transportation industry - and on and on.

Since today's farmer operates in a world market, demand for his products also can be affected by invasion in Afghanistan.

Facts About The BIBLE BY JOHN LEHTI

THE WORK-HORSE OF THE NILE!

THESE BROAD-BEAMED VESSELS, CALLED NAGGARS, CAN STILL BE SEEN ON THE RIVER NILE, JUST AS THEY WERE WHEN THE BABY MOSES WAS SENT DRIFTING DOWN THE RIVER, IN AN ARK WOMEN OUT OF BULLRUSHES, THOUSANDS OF YEARS AGO. THESE STURDY BOATS ARE LOADED WITH CARGO UNTIL THEY ARE NEARLY AWASH IN THE WATER AND SLOWLY MAKE THEIR WAY TO MARKET--IF THERE IS NO WIND, THE MEN LINE UP ON SHORE WITH ROPES AND PULL THE VESSELS ALONG--AS IN SO MANY OF THE "BIBLE" LANDS, THE OLD WAYS ARE STILL CARRIED ON IN THE FACE OF MODERN PROGRESS!

If one baseball is tossed horizontally while at the same instant a second baseball is dropped vertically from the same height, both of them will reach the ground simultaneously.
