## True Success

He has achieved success who has lived well, laughed often, and loved much; who has gained the respect of intelligent men and the love of little children; who has filled his niche and accomplished his task; who has left the world better than he found it, whether by an improved poppy, a perfect poem, or a rescued soul; who has never lacked appreciation of earth's beauty; who has failed to express it, who has always looked for the best in others and given the best he had; whose life was an inspiration, whose memory a benediction.

## INSIGHT INTO EYESIGHT

### Undetected Far-Sightedness

There are many people who suffer from far-sightedness (hyperopia) and are quite unaware of it. How is this possible?

Frequently, people can compensate for this error by ACCOMMODATION. They unconsciously strengthen the curves of the crystalline lens, increasing the refractive power of the eye so that the image comes into focus on the retina.

Thus, they see clearly-but the energy it takes will often result in eye strain. They may also find that near work or reading will be particularly tiring. Yet, because accommodation is an unconscious effort, many persons may be totally ignorant of their far-sightedness, especially if the degree of error is small.

If you are suffering from eye strain, you should consult with your eye care specialist without delay. Far-sightedness is easily corrected with a convex lens. This adds sufficient power to the eye's optical system to allow the crystalline lens to remain in the flattened state normal for distance vision.

### Are Child's Teeth On Schedule?

Children's teeth are somewhat like trains or airplanes. If they don't arrive on schedule, you (or rather your child) may be in for a problem. How do you know if the permanent teeth are replacing the primaries on schedule? Here's the "ballpark" timetable for you to use as a reference.

Between the age of 7½ to 10, he should have four permanent incisors in front as well as a primary canine, first and second molar, and a permanent 6-year molar on each side. This gives him a total of 12 teeth in each dental arch.

By the time he's 12, he should have lost the primary (baby) molars. The permanent premolars should have worked their way through his gums to replace them. So should the permanent canine teeth. The last step is for all four 12-year molars to emerge behind the 6-year molars. This should happen between the ages of 11 and 13.

There is no exact "date" when all permanent teeth should be in. But there is a normal schedule of events. If your child is not "on schedule" there may be a problem. You'll need a dentist's help to correct it.
