### LICENSE PLATES BECOME SAFETY DEVICES

It is interesting to note that people who live in Deleware, Maine, Louisians, Minnesota and South Dakota receive reflective license plates, which are widely recognized as an important safety device, in fact one of the best to be developed during the past decade.

Most of the plates can be seen from 2000 feet away at night. They were first issued in Maine in 1949. Other states have since recognized their value and their use has grown. Since almost two thirds of all accidents occur at night, safety experts deem this a practical way to reduce accidents after dark. year py

One of the important features of reflective plates, experts say, is that they are probably the only safety advance that could be put on all automobiles - old and new ones alike-within a relatively shor: time. Within a few months after individual state legislatures approve reflectorization of its state's plates, they can be made in their own correctional institutions and issued. Once these plates are on, cars equipped with them are much safer at night. Unlike lights, these plates are not hampered by mechanical failures or adjustments. They are made of a light-reflecting sheeting applied ---on a metal base.

These plates cost motorists only 25 to 50 cents a year. Some states have even made reflective plates cheaper than the non-reflective kind, according to a recent report in Public Safety magazine, the national Safety Council publication.

South Dakota's secretary of state, after extensive tests by South Dakota law enforcement officials said recently "The reflective license plate exceeded expectations in all cases. The conclusion of the viewers was unanimous - that reflective plates would add immeasurable safety to the highway by making vehicles visible at greater distances, thus providing greater reaction and braking time to approaching motorists."

This advance in our desperate need for safety on the highways will be universal in time. Let us hope all states adopt them soon.
