Poorly Nourished Trees Need Nitrate Fertilizer.

A mid-season application of some nitrate fertilizer, like nitrate of soda, will prevent peach trees from dying during summer for lack of nourishment.

Glenn O. Randall, extension horticulturist for the State College of Agriculture, has received a number of letters during the past month stating that peach trees were weakened and dying apparently from winter injury. Research made on the problem showed that the trees generally had only a small amount of foliage, that the leaves later turned yellow and died, that the roots were apparently not hurt and new shoots came out, and in some cases that there was a dark brown discoloration under the bark on the side showing the injury.

"This was not due to such winter injury as severe freezes but to an undernourished condition of the trees," says Mr. Randall. "Evidently the trees had not received sufficient nitrate fertilizer to keep them growing late in summer. The wood ripened too early or the tree went into its rest period too early and this period came to an end before the freezing temperatures of early spring were over."

"A midseason application of nitrate of soda at the rate of 1/2 to 1 pound per tree for one year trees; 1/2 to 1 pound for trees two years in the field; 1/2 to 1 pound for three year old trees; and 1 to 1 1/2 pounds for trees four years in the field would be very beneficial. This application should have been made about the last week in May but even now late applications would help."

Mr. Randall states that there are other causes for similar conditions affecting peach trees. They may be hurt by borers, nematodes, root-knot or poor drainage; but, the grower should keep in mind that a vigorously growing tree is less susceptible to disease and other detrimental troubles than the poorly nourished tree.
