People, Spots In The News

TRIPLETS, a rarity among tigers, shown with Tiger Girl at Erie, Pa. zoo.

DOUBLE-DUTY litterbag for travel trash to HELP Keep America Beautiful also appeals for roadside aid.

THUMBS UP sign is given happily by Janice Aldrin, 11, moon-visiting astronaut's daughter.

SUPER-CANTILEVERED is this new pipeline bridge over the Danube near Vienna. They say the "main plane structure is formed by two surfaces consisting of suspension and support cables inclined against vertical line."

Garden Time

By M. E. Gardner

Have you decided which season of the year you like best? Spring? Summer? Fall? Regardless of your choice, I believe that we will all agree that the fall season is a beautiful time in the Old North State, and especially in our mountains.

Should you need a little prodding to convince you, I would suggest that you select a section of the Blue Ridge Parkway between Fancy Gap, Va. and Clingman's Dome in the Great Smoky Mountains. You will be rewarded, beyond measure, by the beauty that unfolds before your eyes as you round each curve in the highway; or capture the views from the many parking overlooks.

To understand the reasons for fall coloration in the leaves, we must go to the plants themselves and find what makes the color in the first place. It is complicated but perhaps we can simplify enough to be understood.

Leaves are the manufacturing centers for all plant food and they are green because they contain chlorophyll. It is the chlorophyll which manufactures the sugars which supply the food essential for plant growth.

These sugars are manufactured in the leaves during bright sunny days and are distributed throughout the plant by a maze of pipes and tubes, made up of many different kinds of cells. The most rapid manufacture takes place during the spring and summer months when the light intensity is greatest and the days are longer.

In the early fall, the days become shorter and night temperatures begin to dip. When this happens the sugars are not moved around in the plant, as they were under higher temperatures and longer days, but become trapped in the leaves and build up rapidly.

This is the signal which triggers a slowing down of the manufacture of chlorophyll as it is destroyed in the leaf faster than it is produced.

When this happens the leaves lose their green color and we see an intensification of red and yellow pigments which have been present in the leaves all the time but masked by the green chlorophyll. The loss of chlorophyll and the intensification of the other pigments account for the beautiful fall coloration in our foliage.

Don't miss the colorful parade this fall. October is a good time to plan your trip.

FCX introduces WEEVLCHK

New Weevil-Resistant Alfalfa!

Here's the variety that can put you back in alfalfa production. New WEEVLCHK is the first available alfalfa having measurable resistance to the alfalfa weevil! In comparison with older varieties after weevil attack, WEEVLCHK

Shows less feeding damage
Recovers faster
Yields more

AND has extra palatability. Animals eat it readily. Fine-stemmed, leafy.

WEEVLCHK is available only at FCX. Supply is limited, so call us, reserve your needs now.
