### Common-Souse Ploughtny

Soil ought to be ploughed just as deep as there is good soil. If the good soil is only four inches, six inches or eight inches deep, that is the depth to which it should be ploughed. But the undersoil ought to be loosened with a subsoil plough to enable the roots to penetrate for more water in dry sea. sons, and they will also find tertifizing elements with the water, although not so much as in the surface soil. The first four inches of soil is the most im. portant to most plants, as it is the first will be found in that space, and for that depth the soil ought to be in fine search of plant-food. Some plants Pair used in cleaning up. have tap-roots that go deep in the Guinea hens keep hawks away, it up, but the main feeding tools are to other lowls. near the surface. Here, Tom, Kene racky.

An English paper, in commenting upon the subject, remarks that the Cheshire Tarmer, by free use or benemanure laid on the grass lands, makes his farm which at one time, before the application of bone namure, to bonly twenty head of cows, now head forly: In Cheshire two-thirds or more, nemerally three-fourths, of a dairy racin are kept in perfect pasture, the remainder in tillage. Its darry farmers are evenmorely bound to lay the whole of their manure, not on the arable, but on the necessary for the arable. The chief improvement besides dramage consists. in the application of lean manure. In the milk of each cow, in its unite, in reared and sold off a farm, it parts time as is contained inchest a handred
