**He Was Under Oath.**  
The late Professor Rowland, of Johns Hopkins University, was the most eminent physicist since the days of Joseph Henry. Among his notable achievements in the realm of pure science was the calculation of the mechanical equivalent of heat and the use of gratings in spectrum analysis, for which purpose he devised a machine that could cut 40,000 lines to the inch on a plate of polished metal. In the practical application of his knowledge he was noted as the inventor of the multiplex telegraph apparatus.  
Some years ago, testifying in a case involving the Cataract Power Company, in answer to a question as to cross examination as to whom, in his opinion, was the greatest American scientist, he replied, "I am."  
After leaving the courtroom one of the lawyers ventured to criticize this answer for its effect upon the jury, whereupon Rowland exclaimed: "Well, what else could I say? Warm, I understand."—New York Globe.

**Automatic Program.**  
Although one of the most popular like the Wright brothers and Henry Ford, you probably demonstrated the possibility of human flight with airplanes, the inventors of such machines are putting out a great variety of devices, which command much serious attention. At the Aeronautical Exposition in Paris a dozen or more types of these machines, including those of the Wrights, Farman and Blériot, were displayed, together with a large number of monoplane motors, screws, and other apparatus intended for use in aviation. From the quantity of these things, the ingenuity and faith shown in their making, and the interest that they excited, one might derive the impression that the manufacture of flying-machines is already an established industry.
