MRS. R. W. ALBERT
 "I could hardly retain food, my liver was disordered, I was dreadfully constipated and suffered with sick headaches. I had lost so much weight and strength that I hadn't the energy or life to do anything. Sargon gave me a splendid appetite and my digestion is perfect. I never have headaches, I'm fast regaining my lost weight and have just lots of new strength and energy."
 "Sargon Pills relieved me of constipation, cleansed my system of poisons and left me feeling toned up instead of causing that weak, let-down feeling produced by the usual laxatives."—Mrs. R. W. Albert, 1802 Blanding St., Columbia, S. C.

COWS NEED ATTENTION DURING HOT WEATHER

By F. H. JETER
 Raleigh, June 23—To maintain high milk production during the summer, it is necessary that the dairy cow have sufficient feed, plenty of shade and a good supply of fresh water.

"As the summer advances, the grass gets dry and short and its content changes from high protein and low fiber to low protein and high fiber," says J. A. Arey, extension dairyman at State College. This condition necessitates the feeding of more grain with a high protein content together with silage or a soiling crop. Grain feeding during this period should be as heavy as during the winter months.
 Hot weather will generally de-

crease milk production and Mr. Arey suggests that the animals have ample shade during the hot part of the day. Around cities, where the pastures and lounging lots are small, he advises that the milking herd be stabled during the middle of the day.

Flies are also a source of a great annoyance to cows in summer, and Mr. Arey says unless some method is used to combat them the best results from the herd cannot be obtained. Flies are controlled easiest by destroying the breeding places, he says. Stalls and pits should be cleaned at least once each week and the manure hauled from the barn direct to the field. Any accumulation of litter or garbage furnishes ideal breeding places for flies and should be cleaned up as often as possible. Because it is impossible to destroy all flies in the larva stage by cleaning up the breeding places, it is further necessary to use poison, fly traps and sprays to kill off the younger brood after hatching, recommends Mr. Arey.
