Experience has demonstrated that objectionable smoke may be prevented even though soft of bituminous coal be used exclusively as fuel. By care ful firing, either by hand or a mechanical stoker or feeder, fresh coal can be evenly distributed over the hot furnace bed. This with the aid of mechanical devices designed to perfect the draught and so cause a sufficient uniform degree of heat to reach all parts of the coal, avoids a "smothering" which produces a lower degree of heat favorable to the separation of the material which makes smoke from the body of the coal.
