Found Baby on Sand Bar.

Louisville, Ky., May 6.-River men

today found the body of a baby boy, arpparently about 3 months old, on a

sand bar in the Ohio river. The baby

had evidently been thrown from the Kentucky and Indiana bridge, with the

idea that it would strike the water and

be drowned. Instead it landed on the

sand bar but with such force that its

skull was fractured. The child, with

the exception of the ugly wound in the

head, bore no marks indicating vio-

lence. Its underclothes were hand em-

broidered and outer garment was a

Incubators.

The present development of the poultry industry requires the use of artificial incubating and brooding. To the common hens of no particular merits ly necessary, to the small farmer they there is a great saving of time, labor and money in using them for hatching.

Prices range from \$5 up. Two styles of incubators are in general use, hot water and hot air. For small machines, up to say 500 eggs hot air is extensively used. The larger machines from 500 to 50,000 are usually of the hot water system. They are divided into compartments of 500 or 600 eggs, and each compartment sepas good as any for the kind of treat- arately regulated. The small hot water in the nest. It should be ment given, as corn is a good feed to machines are usually cheaply cond every three or four weeks. fatten and enables them to withtand structed and are liable to leak or freeze in winter. The large machines are under expert care all the time.

Think of hatching 50,000, eggs by hens. Wouldn't it be quite a task? Yet it is successfully done at one time by using

one large incubator. Tradition, attributes the priests of you are dealing is re- eggs are high. They will only lay in the Temple of Isis as being the inventors of artificial incubating. They have used baking ovens successfully for centuries. They were so expert that they would exchange 600 young chicks for 100 eggs.

Little improvements were made in incubators until about 30 years ago. Since that time the American market has been flooded with incubators of all descriptions.

It requires from 3 to 10 gallons of oil to run an incubator for a period of 21 days. The first day run the machine at 102°, then increase to 103° and hold Chicks when hatched are wet, and in drying the evaporation of moisture incubator manufacturers recommend 105° as the correct heat at that time.

Eggs are not turned during the first two days, this gives the germ a chance to grow without danger of breaking the slender cords. A slight jar will ruin the eggs. After two days remove the eggs from incubator and turn twice daily until the chicks begin to pip the shell. Then do not bother them until the hatching is completed. Opening the door during the hatch will stop incubation and chill chicks. All incu-Bators are sent out with complete in structions and by following the instructions a good hatch can be relied upon provided the eggs used are of good healthy stock and not too old when placed in the incubator. The quicker they are uncubated the stronger the

chicks hatched. A good incubator should have the following requirements: To be made be such a mortality of also with eggs and stock. If it be of unshrinkable material, double glass doors, well ventilated, a perfect regulator and a chick tray or nurs- afflicted with a scrofulous head for ery. An accurate thermometer is abso-

A large percentage of eggs will hatch from the disease. All medical attenif incubator is run in a cellar, the tion was given him, but proved fruitregulation is then easy. The lamps less. By accident I met Mr. A Thies, should be cleaned and filled daily. and while speaking with him about my Some of my friends who are poultry son's condition, he remarked that he cranks and possess both hot water and was in possession of a Salve whose hot air machines have removed the healing qualities had been tested on oil lamps and substituted gas burners.

There is absolutely no danger and better regulation is maintained.
