North Carolina Mines

Prof. Hanna Charlot's Democrat: The Ore Knob mine, in Ashe county, the iargest copper mine in the Atlantic States. It is the best paying mine I know of. Last year the ecupany owning it declared four or five-1 think five-

it declared four or five-- I think five--dividends of \$25 000 each. The Cooper Knob mine is in the same county. It yields a gold and copper ore which decand a smelting treatment pri marily The ore is the richest of its kind I know anywhere, but I think the quantity is somewhat limited. I believe that smelting works are to be erected soon, so that the mine may be satisfactor vib nearested rily operated

In Burke county is the famous Brind letown locality, still active with an abun dant supply of "gravel." I have seen several flumes, or channels through which water is brought with a great fall, throughout the "gravel" section of Ruth etford, Burke and McD well fify feet Of course they are quite expen high sive Tunnels, too, sometimes become necessary in bringing the water. The Vein Mountain mine, in McDowell, will some have a large ditch constructed and will probably be at work early in the season. Several other properties in this section are reported to have been secured or bargained for, with reference to work of this nature

Throughout this section and extending Throughout this section and extending into Polk, are a number of small indivi-dual operators, whose aggregate produc-tion is surprisingly large. I myself can point out \$15,000 a year which is pro-duced in this way, and I think it would be entirely safe to say that at least \$20,-0/00 is produced in these four counties in this manner. It is a very ordinary sight to find where some small stream crosser a public road in this section three or four workers, very often women washing and digging away at an ore bank or bed of "gravel." I wish I could state improvements

from the various patent processes, but I ean't. From these even less advantage has accrued than I anticipated In most of the processes directed to the treatment of sulphurets the great mistake made is in the supposition that to desulphur:zis the only thing to be accomplished. Oxidation is substituted, but mercury is just as insufficient with an oxidized ore as with the original sulphuret. Chlorias with the original supports. Colori-nation has been practiced with much success in the West, but there seems to be something in our North Carolina ores which defis this. The Mears process, which is in operation at the Mt Pleasant Coloring the December of the December of the State (Cabarrus county) and the Davis works pressure (forcing the chlorine into the ere so as to reach the $g \cdot id$) and may result favorably, as it is different from the ordinary chlorination.

Put Clover on Your Land.

An Ohio paper says that by clovering, hundreds of farms that were about worth less have been rescued f om dilapidation and rain It is an accepted traism that as long as "clover will catch," the farm can soon be restored to paying fertility, and by a good rotation is even getting more productive and profitable; for after come years of such trearment the land will bear harder farming-that is, two or three crops may succeed a good coat of clover before laying down to clover again. Rough new land should be sab dued by the use of large clover Nothing so effectually rots out stumps, and kills weeds and sprouts, and prepares the land for the plow and good paying crops. Wild, new lands should always have it sown on the first grain crop down. It saves a vast amount of labor, for in a few years it so tames the ground, and elears it of the enemies to the plow that it works like old ground and is good for fall crops One great error is often fal-len into, and that is, following the old tradition that a bushel of clover seed will d, for eight acres. That may have been enough to clover land partially when it was new, but whoever aims at getting up his land in a speedy and profitable way, should sow a bushel on four acres. so that his land may be thoroughly shaded.
