### Kind and Varieties of Fruit

Suitable for Home Orchards

Every home should have some fruit, whether there is much or little space available. Most of the lots in towns and cities have sufficient space for a few trees, and such space could not be made use of in a more profitable way than to set fruit trees on it, provided one will give them the proper attention. And there is no reasonable excuse for anyone in the country not having a home orchard of some size.

Fruit trees can be set in the South any time during the fall, winter or very early spring. Of course they will have to be set before the buds begin to swell in order to give them a fair chance of living.

When setting fruit trees for home use the selection of varieties is of utmost importance, because what one wants is fruit ripening over as long a period of time as possible. The commercial fruit grower usually confines his efforts to a comparatively few varieties. The varieties that are best for commercial growing are not always the best for home use, and as said above, it is of the utmost importance that the proper varieties be selected whether one is growing fruit for home use or for commercial purposes.

### Fruit Trees Will Not Stand Wet Feet

The peach tree succeeds in practically all sections of the South, but there is one thing that a peach tree will not stand, and that is wet feet. Few, if any fruit trees will do this. Therefore one of the best first things to do is to see to it that the land where the trees are to be set is properly drained. A low, wet place is always to be avoided, unless, of course, it can be properly drained.

It is also important to select as far as possible for fruit trees, ground that is properly air drained, as well as water drained. It is a well known fact that cold air is heavier than warm air and settles to the bottom. Therefore whenever it can be done, select a high piece of ground for the fruit trees, so as to insure as far as possible, proper air drainage. This will go a long way toward preventing damage by late frost and freezing, because it is always in the low places that are improperly drained that the greatest damage from late frost takes place. Of course where one has only a limited amount of ground available, it may not be possible to select a high place to set the trees, but this is the ideal that should be approached as nearly as possible.

### Kinds of Fruit to be Planted.

Now a little more as to kind and variety. In practically all sections of the South, one should have in the home orchard, some peaches, apples, plums, pears, cherries, Japanese persimmons, grapes, and figs. In the lower part of the South, cherries and apples do not succeed to any great extent. This is especially true of the cherry. When one is in a section where these two do not succeed, eliminate them and plant more largely to the fruits that do succeed well in the lower part of the South, such as figs, grapes, Japanese persimmons and peaches.

The following varieties of peaches will give ripe fruit the entire summer season: Mayflower or Early Rose, Carman, Hiley, Belle of Georgia, Elberta, Heath Cling, and Salway or Krummel's October. By planting some of all of these varieties, ripe peaches may be had from late September or early October. The very early and the very late varieties are not very good as to the quality but coming early or late, they are usually very greatly appreciated. Therefore for the home orchard, be sure to plant at least a few of the Mayflower or Early Rose, Heath Cling, Salway or Krummel's October, The Carman, Hiley, Belle of Georgia and Elberta are well known standard varieties that possess very high quality.

### Plant Early, Medium and Late Varieties.

By planting some of all the following varieties of apples one will have ripe fruit during the whole season from June on into the fall and winter: Early Harvest, Early Transparent, Red June, Horse Apple, Grimes' Golden, Jonathan, Delicious Winesap and Yates. These are not all of the good varieties but are generally recognized as being among the leaders for use in home orchards in the south. Early Harvest, Yellow Transparent and Red June are all early summer apples. The Horse apple comes along in mid-summer and Grimes' Golden and Jonathan are late summer or early fall varieties. These are followed by Delicious and then the Winesap and Yates in the late fall or early winter.

Of the plums, the Red June, Abundance, Wild Goose and Damson make up a choice selection for home use. The Damson is especially good for preserving, and the other varieties named to be eaten as fresh fruit. Where room can be given for only two varieties, Red June and Abundance will probably be the best, unless one especially wants some of the Damson variety for preserving.

only a few varieties should be planted in the south, except in the upper portions. In the lower part of the South the Sand Pear or Pineapple pear should be planted, as it is blight proof and is excellent for canning and preserving. The Kieffer, while not blight proof, is not so susceptible to this disease as the other varieties and where one does not wish to grow the Sand or Pineapple pear, the Kieffer is probably the next best choice. Other good varieties are Garber, Seckel and the Bartlett.

Except in the lower part of the South, every home orchard should have in it a few cherry trees. Only the sour varieties will succeed in the South. The Montgomery and Early Richmond are two of the best of the sour varieties.

One or two trees of the Japanese persimmon should be found in every home orchard in the South. It will succeed wherever the native or wild persimmon grows. The fruit is especially large, being as large as a good sized peach, and is delicious. Tane Nashi variety is the leader.

By All Means Plant Grapes.  
Grapes will grow practically anywhere in the South. The leading varieties are Concord, Niagara, Delaware, Moore's Early, Diamond and Lutie. If one has room for only two

or three varieties, our choice would be Moore's Early, Diamond and Concord.

In the middle and lower part of the South, figs grow well. By giving slight protection during the winter, they can usually be grown to advantage in the upper portions of the south. The two leading varieties for most sections of the South are the Brown Turkey and the Celestial. The Celestial is a small, sweet variety and is hardiest of all. Therefore in the upper part of the South, only this variety should be planted.

By planting the above varieties in the home orchard, one will have started in a way to secure ripe fruit from early until late, and that is what is desired. A superabundance of fruit during a short season of the year, with none at all during the early and late part of the season, is undesirable from every standpoint. By planting the varieties mentioned above, one will overcome this trouble and have a supply of fruit for the entire season. Certainly no home where there is even a small amount of space available, should be without a few fruit trees. They are inexpensive, comparatively easy to handle, if one will only give the matter a little study, and will prove not only a pleasure but a profit to those who will give them the right attention in the way of pruning, spraying, cultivating and fertilizing.

ing, spraying, cultivating and fertilizing.

Special Tobacco Fertilizer

47 prizes were won in 1923 on tobacco grown over Southland Special Fertilizers, at Fairs held in Danville, Va., Raleigh, Roxboro, and Mebane, N. C. Then ten tobacco planters who won these prizes believe that there is a difference in fertilizers. They know that for growing prize-winning and top-notch selling tobacco it pays to use the best fertilizer that money can buy. Since both the quality, yield per acre, and price of the tobacco, influence your profits, why not use the best? For prices address: The Southland Guano Company, Greensboro, N. C.
