However, in most the growing establishment. This will sections except South Carolina, eastgive a space of 160 feet in length, ern Oklahoma and Missouri, early and about 40 feet in width, and will care for several thousand plants. But one of the purposes of the institution is to grow more plants as well as more flowers, so in a little box a couple of feet square are seedlings that will probably develop in three or four years into a thousand new plants, and from time to time the Judge sows more seed, and every once in a while he will have a thousand new plants coming on. Now a thousand new plants take up a pretty good sized space under glass, and about once a year with a new crop coming it will be necessary to add another building or two under glass. This thing is much like crime, for when you start on a career of it it perpetuates itself, and there is no place to stop, and that is why the Judge has planned the central plant with the space about it to add a couple of glass covered houses each year. If he should live long enough there is no telling where

the thing would end. But he has already under way one of the interesting occupations of the Sandhills. His plant has reached such proportions that he has several thou-

#### PROTECT CHILDREN AGAINST DIPTHERIA.

The last two cases of diptheria occuring in Moore County in the month of October, 1927, proved fatal. In neither case could the source from which it came be traced. However, they both had it and died as dead as if source could have been traced up.

As a precaution against future developments of diptheria I would suggest and advise all schools in Moore County, with the co-operation of all parents who send their children to school, to have them emunized against diptheria by having some physician administer three doses by hypodermic, one week apart, of toxine anti-toxine, popularly called diptheria vaccine. To do this for whole county will be cheaper than loosing one child from future cases, and it is without doubt a good protection.
