

**Cows Lungs Cover City Lot**

IF THE spongy sacks which form the lung of a cow were spread out flat they would cover a city lot 50 by 170 feet, according to an estimate made by experts of the Larrowe Institute of Animal Economics. To keep this mass of flesh functioning normally, over 3,000 cubic feet of fresh air are required each hour, which, served to cows in buckets as is water and grain, would mean 320 three-gallon pailfuls every hour for each cow.

A cow needs air (oxygen) to purify her blood, to digest and assimilate feed and turn it into heat, body repairing material and milk. Add to the well-ventilated barn a plentiful supply of fresh water, good roughage and a correctly mixed dairy ration, and you have all the essentials for abundant milk making. It is this lack of fresh air on many farms during the long winter months that is believed by practical farmers to be the underlying cause for much of the sickness among the milchcows.

**Camp Taukeetah Closes 4th Successful Season**

Camp Taukeetah, a girl's camp located near Franklin, closed its 4th successful season August 26 with the annual banquet. Girls who had had the pleasure of attending the camp this summer left the following day.

The banquet was featured by toasts and the awarding of emblems, honors, and monograms. It proved altogether a most delightful affair.

A week prior to the closing a swimming exhibition had been given at the camp lake, and some two weeks before the closing the young women had staged a very beautiful dance drama.

Miss Olive Patton, who heads Camp Taukeetah, reports a total attendance of 45 girls during the summer. She is preparing for an even larger number next year.

**RADIO HINTS**

ONE of the things to remember about your storage battery is that fire and flame must be kept away from it.

The storage battery, if it is in proper working order, gives off hydrogen gas fumes. The volume of gas is not great and the fumes are not dangerous to human health when the battery is kept in an ordinary room with reasonable ventilation. Under certain conditions, however, these fumes are inflammable and the gas sometimes will cause an explosion, if it comes in direct contact with an open flame, such as that of a match or a candle.

If your storage battery is kept in a dark, out-of-the-way corner and you must examine it frequently to see that the acid solution is at proper level and the terminals and contacts in good order, don't strike a match to provide your light. An ordinary electric flashlight is more convenient, gives a better light and—most important of all—is safe.
