ERWIN (84) - Laetsch 8. but more importantly it im-Rogers, Brown 2, Davis 10. proved the Rockets' conference record to 7-0

Genetic Potential Is Base Beef Herds Build On

By DR. J.W. "PETE" PATTERSON Extension Specialist, NCSU Genetic potential is only one of three keys to successful production. Beef cattle with high genetic potential coupled with a sound feeding and management program will always result in success. With the present price of feed and

labor, it is not wise to operate a cattle operation with less than the best genetics available. It then behooves every beef producer to be on the prowl for a good bull. The little four letter word, "good," placed before the word "bull' eliminates over one-half the supply before you start (all below the herd average.)

Cattlemen drive thousands of miles and spend hundreds of hours of time visiting herds, shows, and sales in search of the good bull. This is expensive and time consuming but all justifiable because the key to genetic improvement is bull selection. The bull represents one-half the genetic potential of the calf crop; and, in subsequent years, his daughters and granddaughters remain to pay big dividends. In short, a good herd bull never stops working for you; and for a sorry herd bull, you never get him paid for because of the loss in potential production.

A test to determine a good bull is that when bred to a group of cows they will produce offsprings that are superior in value compared to those now being produced. In the case where a good bull is now being used, the calves will be of equal value. It is more difficult to find a bull that will keep a top herd good than to find a bull that will show improvement in an average herd

With these facts in mind, when and where can the bull with the most genetic potential be purchased for the least amount of time and money? An excellent place to start looking is at any of the many central bull test stations over the country. Here you have bulls in most cases that were the top calves in their respective herds. Their 205day weight ratios tell you where they stood in relation to the herd average. Once at the station, they compete with the top bulls from many other herds. At the end of the 140 days, you have as much information as can be collected to assist in making the most important decision in the cattle business, that being which bull to purchase and turn with the cow herd next

March

and 140-day records indicated they would? If so, you have a year's head start; and the last test is, will their daughters reproduce and milk? When this test is passed, you not only have a good bull, you then have a great bull.

To find a herd bull that you can put the four letter word "good" before is a long and expensive process but one that pays big dividends for many vears.

Central Bull Test Sale on January 24, and at Statesville on February 27. The kind of calves you have to sell when the prices are higher will be determined by the bulls you buy this spring. I believe your dollars will buy more bull this spring, so don't let present low prices for feeder cattle cut your profit in the future. Take advantage of the present situation and buy a "good" bull this spring!
