BIRD CLUB

The bank swallow is the smallest member of the family and derives its name from its habit of boring a tunnel into a bank, along a road or stream. There it builds its nest. In its engineering work this bird uses both bill and claws.

An enlarged chamber, lined with grass and feathers, at the end of the tunnel is the place where the pearl-white eggs, four to seven, are laid during the latter half of May.

Bank swallows nest and migrate in colonies. The plumage of this bird is dull gray above, with lighter underparts and a conspicuous band across the breast. It lives principally on insects caught while in flight. All swallows have large mouths and long wings, by which they are well adapted for catching insects on the wing.

They sometimes eat small wild berries. Their breeding grounds range from Central United States to the Arctic regions.
