DOUGHNUT MACHINE INSTALLED IN CAFE

Delicious Circles Of Goodness May Be Obtained At Nu-Way

A Downyflake doughnut machine was installed Monday in Tom Shugart's Nu-Way Cafe, and is proving a mecca for those who like deliciously cooked doughnuts.

The machine is not a large affair but is a very fascinating piece of mechanism. Everything is so clean about it that the doughnuts are at no time touched by hand.

The machine is a replica of the large machine that has been operating at Times Square, New York City, the most expensive corner in the world from a rental standpoint. So delicious are the doughnuts and so popular that the operator of the machine there can afford to pay \$65,000 per year for his site.

The doughnut machine at the Nu-Way Cafe, which will turn out 10 dozen an hour, uses two-thirds less grease than is necessary for the average doughnut cooked the old-fashioned way. So highly rated are the cookies that the Good Housekeeping Institute has set its seal of approval on both the machine and the mixture used to make the doughnuts.

Everyone with a liking for fresh, crisp, really delicious doughnuts are invited to visit the Nu-Way Cafe.

TIMELY FARM QUESTIONS ANSWERED AT STATE COLLEGE

Question: What is the most profitable number of cows to keep for a cream producing unit?

Answer: The number of cows kept for cream producing should be determined by the amount of home-grown feed that is available; but, a profitable unit should consist of not less than four or five cows. With this size herd, frequent deliveries of high quality cream can be made at a minimum cost. Frequent deliveries always bring a premium and these cannot be made from one or two cows.

Question: When should alfalfa

be seeded and how much seed is needed to the acre?

Answer: The best seeding dates for the lower Coastal Plain and Piedmont sections are from September 1 to 30. In the upper Piedmont section the seed should be put in between August 15 and September 15. At least 25 pounds of seed should be used to the acre but as a good stand is worth more than the cost of 5 or 10 pounds of seed it would pay to add about five pounds to the above figure and use 30 instead of 25 pounds of seed to the acre.

Question: When should pullets be moved from the range shelter to the laying house?

Answer: Pullets should never be moved until the majority are ready to come into production. Even then, if layers are still in the house, the pullets should not be moved until the house has been thoroughly cleaned and disinfected. The shelters can be moved from range to range and the pullets should be kept on these ranges as long as possible especially if the pasture about the laying house is poor.

Question: I am losing a lot of chickens and I think the trouble is limberneck. The birds lose the use of their necks and become completely paralyzed. What should I do to control this trouble?

Answer: Apparently your birds are affected with limberneck. This trouble is caused by the birds eating decayed animal or vegetable material which is highly poisonous to them. The best method of approach is to confine the birds until the cause is located and removed. This may be in the form of mouldy or decomposed mash or grain, a dead chicken or rat, or some other animal. It would be well to give the entire flock epsom salts at the rate of 3-4 of a pound to two and one-half gallons of water.
