## BE CAREFUL WITH KUDZU

Successful Growth Depends on Proper Cultivation of Plant

### DURING FIRST SEASON

Much of the success in getting a good growth of kudzu depends on proper care during the first growing season, according to County Agent R. R. Smithwick and J. E. Trevathan of the Soil Conservation Service in the Surry County Work Unit of the Tri-Creek district, near Dobson, N. C.

Growth of young kudzu plants will be seriously retarded if they have to compete with other vegetation during the first spring and summer. Clean cultivation is therefore extremely important throughout the entire first growing season.

Proper cultivation includes sufficient plowing along the rows to control other vegetation, to keep the soil well broken, and to keep the vines dragged back to a relatively narrow strip along each row, as well as hoeing weeds and grass out of the rows, if necessary.

Such a system of cultivation will result in a thick stand of plants along the rows by keeping the surface of the soil in good

condition for vines to take root at the joints and develop new crowns. Soil thrown on the runners by the plow induces root formation.

Where corn or some other row crop has been planted in the middles between the rows of kudzu, cultivation of the row crops will control weeds and keep the soil in good condition for establishment of kudzu plants.
