Dr. Frank L. Hess of the U. S. Bureau of Mines, and Mrs. Hess, are spending a part of their vacation in Kings Mountain.

The growing interest of the varied mineral possibilities in the Kings Mountain area is indicated when such high ranking Government Mineral authorities as Dr. Hess finds pleasure in spending his free time in this section. His stamp of approval on any mineral is sure to attract general interest among mining people.

His frequent visits here, on business during recent years has been to improve the geodome information and while this mineral was known to exist by a few mining Engineers and local prospectors the prospects of its being of importance was doubted even by representative of the Smithsonian Institute. But Dr. Hess visited the property and made test. Then gave as his opinion that the ore body could be worked profitably.

This report brought numerous inquiries and visit from mining officials and even investors. As a result all the best known properties representing millions of tons are either under option or bought as investments and at least four different mining companies have properties including one or more private develop-

ments. While the ore is yet in the experimental field from the point of proper processing, the demand is growing and some 12 to 15 car loads have been shipped by a private investor this year.

Q How can I pick out the good hen in my flock at present? I am planning to cull my layers.

A The good hen has a comb that is waxy, full of blood, red in color and pliable. She is in good health, active, alert, and in fair flesh condition and in most cases, free of disease. Her eyes are prominent, bright and full of light. She is retaining her feathers, and is not molting any molt hardly prior to September 1. They lay large or pelvic bones are thin, flexible and wide apart. The abdomen is soft and pliable. On yellow skin varieties, the shanks and feet are white or very pale yellow where the birds have been in lay for some time. The vent is white or pinkish white in color.
