Alexander Graham Bell's First Telephone

From this crude Beginning

... the telephone has been made a world-wide medium of voice communication... a dependable servant, available at low cost, to people in all walks of life. This remarkable achievement is the result of American initiative, organization and ingenuity.

The 21,500 Southern Bell workers have had an important part in this achievement. It is a source of satisfaction to them to know that they, together with thousands of other Bell System workers, have made it possible for anyone today using a Bell or Bell connected telephone to talk to almost any point in America, many foreign countries, and to ships at sea.

Americans enjoy the best, most dependable and cheapest telephone service in the world. They are assured of its continuance because it is the Company's policy to keep telephone facilities and quality of service ahead of public expectation.

Second Baptist Church
Rev. C. C. Parker, Pastor
Sunday School 9:45 each Sunday.
Preaching 11 a. m. and 7:30 p. m. each Sunday.

Cold Weather Nips Ornamental Plants
Boxwood, peonies, ivy and other ornamental plants suffered greatly from the severe winter just past, and more particularly from the "cold snaps" during the early spring says Howard R. Garriss, assistant Extension plant pathologist of N. C. State College. He reports that more than 100 specimens of box plants suffering from cold injury have been received for diagnosis recently by the college plant disease laboratory.

"The cold damage was especially evident in the piedmont section," Garriss declared. In most cases the killing out of plants took place where box bushes were weakened and suffering the effects of the drought last summer, or from other conditions.

The specialist said that fortunate only the young tender shoots stimulated into new growth during the short warm periods were the greatest sufferers from sudden drops in temperature. Where only young shoots are killed, the plants should soon recover with continued warm weather.

Where only twigs have been killed, the plant pathologist recommends that these be pruned out and the bushes be sprayed thoroughly with a 4-4-50 Bordeaux mixture every two weeks until continued hot weather prevails. The reason for pruning out the dead wood, he explained, is to prevent parasites from living over and probably infesting the healthy wood. If diseases are present, the spray will tend to prevent their spread.

Plants heretofore healthy and vigorous, but weakened by the cold weather, will be more subject to disease and they should be sprayed regularly during the current season.

Student Body Begins Clean-Up Campaign
Spring is here, and the Student Participation Organization of Kings Mountain High School felt it since spring cleaning is the custom we decided that we should follow that old custom, by having a clean-up campaign of the grounds.

Each week different grades have charge of the cleaning. The first week the primary grades, the second week the grammar grades and the third week the seniors. All the other high school grades will have a chance to aid in this undertaking before the close of school. This campaign has proved very successful. Improving the students themselves is another aim of the organization. A Citizenship Committee was elected to do this, with Betty Lee Neisler as chairman. We think that this will help the students more than any other undertaking of the organization.—Eoline Keeter.

According to the U. S. Department of Agriculture, the number of cattle on feed for market in the 11 principal corn belt states on April 1 was about 2 percent larger than a year earlier.

Early Poisoning Checks Weevils
Pre-square poisoning to control the boll weevil is expected to find a wider response from North Carolina cotton growers this year, says J. O. Rowell, extension entomologist at State College.

Although the value of this early treatment as an aid in fighting the weevil is not fully supported by experimental evidence in North Carolina. South Carolina growers have reported good results from its use, Rowell said. Field demonstrations in North Carolina last season also indicated good results for the method.

Liquid poisoning by mopping has several advantages over dusting as a pre-square treatment, the State College entomologist pointed out. For the mopping method, no expensive equipment is involved, the cost of materials is slightly less, and application may be made during any part of the day.

The liquid poison as generally used, is composed of one pound of calcium arsenate, one gallon of cheap molasses, and one gallon of water. It is prepared by adding the arsenate to the water, stirring thoroughly, and then adding the molasses. This quantity is sufficient for an acre of cotton. Only the amount needed for each day should be mixed at one time.

If over-wintered weevils are numerous on the young plants, from one to three pre-square poison applications at 5 to 7 day intervals should be made. Treatment is advisable when weevils occur at the rate of 20 or more per acre. Poisoning should be started just as soon as the squares begin to form, and before they are large enough for the weevils to puncture.

The liquid mixture may be applied with a home-made mop, constructed by tying a piece of cloth or sack to one end of a light board five feet long and two to three inches wide. If rain occurs within 24 hours the treatment should be repeated.
