Use

KALETRA is a prescription anti-HIV-1 medicine called a protease inhibitor that contains lopinavir and ritonavir. KALETRA is used with other anti-HIV-1 medicines to increase the chance of treatment response in people with human immunodeficiency virus (HIV-1) infection. It is not known if KALETRA is safe and effective in children under 14 days old.

KALETRA does not cure HIV-1 infection or AIDS and does not stop you from passing HIV-1 to others. You may still get opportunistic infections or other conditions that happen with HIV-1.

KALETRA Safety Considerations

Do not take KALETRA if you are allergic to any of its ingredients, including lopinavir or ritonavir. Do not take KALETRA with certain medicines, as they can cause serious problems, death, or make KALETRA less effective against HIV. Some patients taking KALETRA can develop inflammation of the pancreas and liver problems, which can cause death. Patients may develop changes in heart rhythm, large increases in triglycerides and cholesterol, diabetes, high blood sugar, changes in body fat, and/or increased bleeding in people with hemophilia. Some patients may develop signs and symptoms of serious infections they already have after starting anti-HIV medicines. Please see Brief Summary for more details.

You are encouraged to report negative side effects of prescription drugs to the FDA. Visit www.fda.gov/medwatch, or call 1-800-FDA-1088 (1-800-332-1088).

If you cannot afford your medication, contact: www.pparx.org or call the toll-free number (1-888-4PPA-NOW) or (1-888-477-2669) for assistance.
