

Weekly CPC's (clinical-pathological conferences) offer both student and staff a chance to study in detail pathological findings gained from autopsies and to determine the degree of accuracy of diagnoses made on these patients.

A break from the routine is afforded each year when the medical students take part in the annual hospital disaster drill. Here some students are "victims" while classmates practice evacuating and treating casualties.

Lab work occupies a big part of the student's time during the first and second years, but the knowledge gained here is used daily once the clinical years start.

Practicing on each other, students become acquainted with the many things a doctor can learn about his patient's condition by close examination of the eye.
