When The 'Bo-Weevil' Came To Cleveland County

Bo-weevil, bo-weevil, Why'd you go and stay? Bo-weevil, bo-weevil, Where you been all day? You'll get a lickin' Sure as I'm sittin' On this bale of hay. - Fats Domino

There were plenty of cotton farmers in Cleveland County who in the summer and fall of 1950 wished the boll weevil would go and stay — and who weren't sure when that insect would get its "lickin"."

The boll weevil eventually would be defeated, but not before changing the agriculture — and culture — on which Cleveland County is based. Between July and September 1950, the boll weevil, a type of beetle, ate its way into the wrote an anonymous cotton squares and bolls reporter for the Shelby throughout Cleveland Daily Star. they have been billed and researchers. could seriously hurt the scientists.

An extensive study of the apparently is untrue. aggressive behavior of the report published in Science magazine.

The Africanized bee, so named because it descends from a variety imported from South Africa, were tested against normal European-derived honey bees during simulated attacks on their hives.

In tests on large colonies, Africanized bees rose to the

The so-called "killer attack more quickly and bees," slowly moving north delivered 8.2 times more to the United States, are stings on leather targets every bit as aggressive as than other bees, said the

The report also said the American beekeeping inidea that the Africanized dustry, say U.S. bees would become more Agriculture Department docile as they spread north and mated with other bees

The stinging rate of bees bees shows that they are in Venezuela was about September rains have left more prone to attack than three times higher than normal bees and they do so those tested earlier in in greater numbers, says a Brazil, where the African bees were introduced in 1956, said the study.

Stinging rate is important because of the amount of toxin it introduces into the target. While some people die each year from allergic reactions to a bee sting, most people can survive results of the small amount of toxin in a few stings.

From Extension Reports

wait until January to purchase feed to get cows through the winter. It would be a good idea to inventory feed supplies now to determine if additional hay or grain is needed. Prices go up in the winter.

pastures with little fall summer reduced hay growth for grazing.

Very little fescue can be now. Cows can subsist nicely until they calve.

At calving their nutrient dramatically, and those requirements must be met for the cows to supply milk to support calf growth and rebreed.

An average size cow, 1000-1100 pounds, will need

Cattlemen should not 30 pounds of a good quality hav per day. Over 90 days, that cow will eat 2700 pounds, or close to a ton and a half of hay.

Most growers in Cleveland County had a difficult time putting up hay this year. Too much rain Lack of August and early in the summer and too little rain late in the

The grain supply on the stockpiled even if it rains other hand is plentiful. If feed is short you have a trio of options.

One, supplement your exrequirements increase isting hay inventory with corn or small grain to meet your cows nutrient needs.

Second, purchase addi-

tional hay. Third, plant winter annuals to graze.
