*Repeat* **A NEW, BIGGER DELCO LIGHT**

**T**HIS new 1500 watt Delco-Light consists of a four-  
cylinder engine directly connected to a 1500 watt  
generator and is furnished with an 80 A. H. Delco-  
Light Exide battery, consisting of sixteen 7-plate  
glass jar cells.

The storage battery supplies current for cranking  
the engine and for the smaller current demands.

The operation of this plant is automatic on all  
electrical loads over approximately 250 watts. As  
soon as sufficient lights or power appliances are  
turned on, the engine automatically starts, thus fur-  
nishing current directly from the generating unit.  
When this heavier current demand ceases, the unit  
automatically stops.

**Control:** Automatic control panel provides  
automatic starting and stopping. Battery  
furnishes current for generator to crank  
engine. Electric governor controls speed  
in accordance with electrical load. Choke  
control for easy starting.

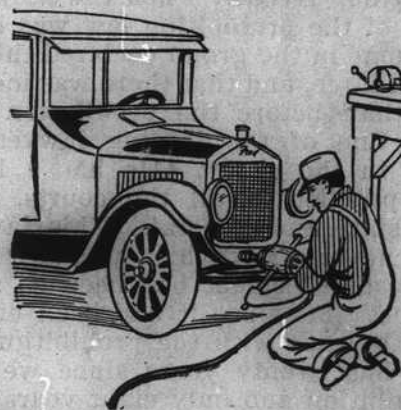

During the automatic operation of the engine-  
generator on the power load (over 250 watts) a  
trickle charge is going into the battery to keep it in  
a charged condition for starting and supplying power  
for light loads. This trickle charge is adjustable to  
meet the operating conditions in the place in which  
this plant is installed.

This combination, automatic, battery charging  
Delco-Light is a very efficient and practical electric  
plant to take care of all loads up to 1500 watts.
