

TODAY and TOMORROW

PLASTICS better homes

How would you like to live in a house where you could throw bricks at the windows and they would bounce back? That is already possible, but even more wonderful things are being done with the new kinds of materials which science calls "plastic."

The discovery that chemical compounds made from such unrelated things as cellulose, corn oil and carboic acid can be moulded into solids which take the place of metal, glass, wood and stone is the latest step in man's conquest of nature.

The transparent sheet which makes your car's windshield shatter-proof is a plastic product. Now they are beginning to make camera lenses of the same type of transparent plastics.

MEAT we import

Americans eat more meat than any other people in the world. The American family which does not have a meat meal at least once a day is a rarity.

Half of our farm lands and more than half of the farm population are engaged in the production of meat.

One of the things which make it difficult to generalize about farm conditions is that there are so many different kinds of farming. What is true of the wheat farmer or the cotton grower is not necessarily true of the livestock and poultry farmers.

PIE for breakfast

Up in Vermont they are bemoaning the decline of the ancient Yankee custom of eating pie for breakfast.

I am all for that. In my New England boyhood we always had pie for breakfast. Everybody did.

A good apple pie is almost a completely balanced meal in itself. It has the proper proportions of fats, starches, fruit acids, sugar and all the rest of the vitamins and proteins to sustain life indefinitely.

NEWSPRINT in the south

I saw a Savannah newspaper the other day printed on newsprint made from southern pine wood.

The discovery by Dr. Charles H. Herty of a process of making newsprint from southern pine is the be-

ginning of an economic revolution. Pine can be used when it is only seven years old; spruce is not big enough to cut until it is thirty.

"The first commercial paper mill to make newsprint from southern pine is now being built. It's a start toward a new prosperity for the south."

WORK and be happy

The longer I live the plainer it seems to me that there is only one secure way of living, and that is by individual hard work.

"One of the most inspiring things I have read recently was a report by Rose Lena Anderson of Clackamas, Oregon. Rose is the national champion 4-H Holstein club girl for the 1936.

How many young women would call that "easy" money? Rose, at least had not been led astray by the false doctrine that "only saps work."

SOIL-BUILDING CROPS ARE ON THE INCREASE

North Carolina farmers who cooperated in the soil conservation program last year increased their acreage of soil-conserving crops by 550,000 acres, according to E. Y. Floyd, of State College.

After tabulating figures compiled from the work sheets covering the co-operating farms, the state AAA office announced that 1,000,000 acres of conserving crops, mainly legumes, were seeded last year as a direct result of the program or in connection with it.

An even larger acreage is being seeded this year as farmers take advantage of the opportunity to build up their soil, check erosion, and balance their farming operations while earning payments from the government, Floyd said.

He also pointed out that last year some 550,000 acres of cotton land were diverted into conserving crops; 200,000 acres of tobacco land and 40,000 acres of peanut land were also diverted.

By diverting cash crop acreage and carrying out soil-building practices, North Carolina farmers earned \$12,403,903 in 1936. Similar rates of payment are offered again this year.

In 1936, more than 127,000 work sheets were signed, covering 14,500,000 acres of farm land. Of this acreage, 5,750,000 acres were considered crop land.

With additional work sheets signed this year, it is expected that 150,000 or more work sheets will be in force for the 1937 program.

BAIT WILL CONTROL TOBACCO BUD WORMS

A pinch of poisoned bait will protect the tobacco plant from budworms, which are active from the time the plants are six inches high until time for topping.

E. Y. Floyd, extension tobacco specialist at State College, says two pounds of arsenate of lead mixed with 50 pounds of corn meal make a good bait.

The bait should be placed in the buds as soon as worms are discovered. Repeat the application in about two weeks; this will eradicate practically all the budworms and most of the early hornworms as well.

Floyd also pointed out that the ridge method of cultivation will produce \$60 worth of tobacco more per acre than will the flat method.

The first cultivation should be begun as soon as the plant shows signs that it is taking root. Cultivate lightly and use a hoe to break the crust around the little plants.

Continue cultivating every week or ten days until about a week before the plants are to be topped. In the second cultivation, begin putting the soil up around the plants to make them develop more roots higher up on the stalk.

Dale Carnegie 5-Minute Biographies

Three Words—"Can You Cook?" Led Him to the Ends of the Earth. Martin Johnson, who photographed thousands of lions in the wilds of Africa, killed only two.

London.—In the middle ages pepper was prized above all spices. The most important early English guild was the Pepperers' Guild.
