Many Bees Are Needed For Crop Pollination

Are crop recommendations of the future likely to be so many seeds, so much fertilizer, and so many honey bees?

This is already the case with some crops grown in North Carolina. Apple and blueberry producers make extensive use of honey bees as pollinators.

Horticulturalists at North Carolina State University are also recommending one to two hives of bees for each acre of pickling cucumbers. The feeling is that other cucurbit-vine crops—might benefit from the same practice.

Traditionally raised for their honey and wax, interest in bees as pollinators is growing by leaps and bounds, according to Frank Meacham, extension entomologist at NCSU.

Bees are important in the pollination of about 50 crops, mainly fruits and vegetables. Farmers have usually relied on wild insects to do the pollinating.

But with the emphasis on high-

er yields, and with the destruction of many wild insects, farmers cannot always rely on wild insects to do the job.

Interest in bees as pollinators is especially keen in California, Meacham said. Bees there are being bred to prefer one crop over another.

Interest in bees is also giving rise to a new type of business in North Carolina. Some farmers are raising bees and renting them to apple and blueberry growers.

Rental prices usually run from \$3 to \$7 per hive, although Meacham believes this figure will eventually settle down as the practice increases.

Apple growers not only make extensive use of bees, but they have figured out several ways to get maximum benefit from them.
