

AROUND THE FARMS IN CHOWAN COUNTY

By C. W. OVERMAN, Chowan County Agent

Japanese Beetle: The 1961 influx of Japanese Beetle has invaded our domain. Unless this destructive insect is controlled from the beginning it can do considerable damage to vegetables, fruit and ornamentals. Some field crops, particularly corn silks, are favored. The time to strike the invader is RIGHT NOW.

Extension Leaflet No. 72 entitled "Vegetable Insect Control" and Extension Leaflet No. 59 entitled "Flower and Shrub Insect Control" include control measures for Japanese Beetle as well as various other insects attacking these crops. These publications are available at our office. Some insecticides recommended for the control of Japanese Beetle are Methoxychlor, DDT, and lead arsenate for ornamentals. Methoxychlor and DDT may be used on most vegetables but not within three weeks of harvest. When you come closer to the harvest period than three weeks, use a 4% rotenone spray which is non-poisonous to human beings.

Nematodes in Peanuts: Several peanut fields are showing nematode infestation by plant stunting. This may be observed in a few plants in spotted areas, in large spots and even large areas in the field. During the last two weeks I have been called to several fields and found nematodes the problem.

The only control for the growing crop is the proper application of Nemagon soil fumigant. The fumigant should be applied at the rate of one gallon to one and one-half gallons of actual material per acre. Fumizone 44E is a 25% material. Therefore, it would be necessary to apply four gallons to equal one gallon of actual material per acre. Fumizone 70E is a 50% material which would require the application of two gallons to get one gallon of actual material per acre. The material is emulsifiable and should have enough water added to make an application of at least five or more gallons of the mixture per acre. The material should be applied on both sides of the plants, six inches from the plants and about four or five inches deep.

When infestation is found, the sooner the soil fumigant is applied the more effective it will be and the greater will be the results. Four years ago, soil fumigant applied to an infested field about this time resulted in an increased yield of about 600 pounds per acre as compared with an untreated check plot.

What's The Score? Home and farm accidents claimed more lives in North Carolina during the month of March 1961 than did motor vehicle accidents, according to data released in May by the Public Health Statistics Section of the North Carolina State Board of Health. Usually, motor vehicle accidents lead the list of accident killers; however, in March home and farm

accidents caused 84 deaths while motor vehicles accounted for 81 deaths. All other accidents claimed the lives of 35 North Carolina residents.

For the first three months of 1961, the accident toll is 593 deaths, just slightly less than the toll—613 deaths—for the corresponding three months in 1960. During the three month period, motor vehicle accidents caused 253 deaths; home and farm accidents, 235 deaths, all other accidents, 105 deaths.

Report Cotton Failure: Growers who have had cotton failure should be sure to report the acreage of cotton failure to the ASC field supervisor when he visits the farm. This will give the grower credit for his cotton acreage just the same as if the cotton was growing. Failure to report cotton failure may result in the loss of allotment.

Feed Grain Program: According to Handy West, ASC Office Manager, the following participation by Chowan County farmers has resulted. Approximately one-half of the farmers in Chowan County have signed agreements to participate this year. A total of 4300 acres of corn land has been signed up for diversion. This means that about 32% of the normal corn acreage in Chowan County has been diverted from production this year. It appears that our farmers are cooperating nicely with the new agricultural administration in trying to reduce the feed grain surplus.

Crop Acreages Being Checked

Continued from Page 1, Section 1
the entire state of North Carolina will check over 300,000 allotments with a total acreage of well over a million and a half acres.

The work of the reporter is only part of the performance check. The reporter outlines the planted acreage on an aerial photograph, and that photograph is returned to the ASC county office where the acreage is computed by the county office staff. The acreage is computed through the use of a planimeter, an instrument which accurately computes the area outlined. Notices of measures acreage will be mailed currently after June 16th. The county office will be unable to give out measured acreages prior to the date notices are mailed.
