Timely Farm Questions

QUESTION: How much wheat may be planted on a farm under the AAA rules?

ANSWER: As much as 10 acres of wheat may be planted on any farm or if no wheat is sold from the farm, three acres may be planted for each family on the farm, although this amounts to more than 10 acres. The Triple-A encourages farmers to pro-

duce ample food and feed on their farms.

QUESTION: What kind of fertilizer should be bought for tobacco plant beds?

ANSWER: Tobacco plant bed fertilizers should contain 4 per cent nitrogen, 8 per cent phosphoric acid, and 3 per cent potash. The addition of one per cent available magnesia will be beneficial in certain cases and its inclusion is generally recommended by L. T. Weeks, Extension tobacco specialist. However, he says that injury due to excess of chlorine has been widely observed in tobacco plant beds. Since fertilizers are applied to plant beds in relatively large quantities, even a small percentage of chlorine may cause injury. Only such materials as are practically free of chlorides should be used for making plant bed fertilizers.

QUESTION: When should lespedeza seed be harvested?

ANSWER: The Common, Tennessee 76, and Kobe varieties ripen for seed about November 1 or at the first killing frost. They should then be harvested as soon as possible to prevent losses from shattering, says E. C. Blair, Extension agronomist. Korean seed will remain on the stalk five or six weeks after they mature. In fact, they do not loosen enough to permit the use of a seed plan until three or four weeks after ripening. Korean usually matures early in October.

Boiling Springs News
