FACTS ABOUT PLANETS. Venus, Mars, Mercury, Jupiter, Saturn and the Rest.

Venus, so well known to us all as the loveliest object in the heavens, the evening and the morning star, resembles closely our own earth. Its size is about the same, its diameter being 7,660 miles; its day is almost the same length, and its density is rather less than five times that of water. It revolves round the sun at a distance of 60,000,000 miles in the space of 224 days. Like Mercury, however, Venus is moonless. Passing the earth in the meantime, we come to the well-known red planet, Mars. This planet is particularly interesting in many points of view. Next to Mercury, it is the smallest of the four interior planets, its diameter being only 4,200 miles, or little more than half that of the earth or Venus. Its distance from the sun is 141,000,000 miles, and it completes its circuit in 687 days. The length of its days does not differ materially from that of our own. Mars has two moons, and one of them presents a phenomenon unique in the system. No other moon behaves like this one, for it goes round Mars about three times every day; that is to say, it goes faster round Mars than Mars does on its own axis. Imagine our moon rising and setting three times every twenty-four hours. Another interesting feature in Mars is this: We can see through our telescopes what seems to be the conflagration of its con-

tinents and oceans and also accumula-

tion of snow at its poles. We next turn our attention to the other group of planets—Jupiter, Saturn, Uranus, and Neptune. These are distinguished by their enormous size, immense distance from the sun, rapid revolution on their own axis, and very small density. The change from Mars to Jupiter is indeed remarkable. The atter planet, familiar to every observer of the heavens, is indeed a giant among giants. In mass it is equal to all the other planets put together, its diameter being no less than 85,000 miles, and its distance from the sun 682,000,000 miles. It takes 4,332 days to complete its yearly revolution. Although of such enormous dimensions, it turns on its own imagine it to be composed, in great land. From certain phenomena on its surface it is evident it is almost completely enveloped in clouds, and it is doubtful if we have actually seen the real solid nucleus of this planet. Jupiter is attended by four moons, which revolve around him at various distances. The study of these bodies is of great interest; from watching their movements we got the first hint of velocity of light. Next in order in our outward journey comes Saturn, at the distance of 884,-000,000 miles from the sun, and taking no less than 10,759 days to complete its revolution round that luminary. This planet, though less than Jupiter, is still them, with these eight moons and me-

How Cameos Are Cut.

The art of cameo-cutting was introduced into the United States in 1850. It has made no progress. Finished cameos sell for less now than they did then. The only two manufacturers of cameos in the United States are in this city, and they find very little work to do. The greater part of this trade is in imitating antique gems or in matching cameos brought from Europe. There is probably no business requiring so great artistic skill and such delicate manipulation

"Any man would be a fool to learn money by it. I have to import all my workmen from Europe. I tried to teach two apprentices, but they found that

Guarantee more Reasonable Rates than any house with the policy of the Housekeeping Department. Guarantee it is executed in relief, while the latter is a sunk engraving. Cameos are best cent in minorals with the policy of the Housekeeping Department of the Housekeeping bands of two or more distinct colors. The raised engraving is generally of one color, while the background is of a strongly contrasting color. The former is generally white and the latter dark. The cutter draws with a lead-pencil on the white surface of the block the design which he intends to produce in cameo. He then follows the outlines with a diamond, and cuts away the white parts outside. If the stone is small, he cements it on the end of a stick; if large, he holds it in his hand, and proceeds to work upon it with fine drills. He sits at a table like a sewing-

machine table, and by a treadle works a small lathe situated at his right. At his left is a frame filled with drills made of steel wire and of all varieties of shapes. The ends of the drills are covered with diamond dust ground in olive oil. The dust is obtained by crushing uncut diamonds by blows of a hammer in a small steel mortar. The cutter has placed before him a picture, or model of the subject to be made. Everything then depends upon the correctness of his eye and his artistic instincts. The work is inexpressibly slow, but when completed it is marvelously perfect. Although very small the figures delineated are as complete in every detail as though they were ten feet high. Anecdotes of Butler.

I heard yesterday the first true version of the monkey-and-hand-organ story which has been privately told in many circles here now and then, but not al ways correctly. It comes to me from a high Treasury official, who had something to do with the settlement of Gen. Butler's army accounts. These accounts are very large, and some of the items seemed out of all nature to the expenses probably incurred. After Butler had, however, explained them, it was seen that they were perfectly right and proper. There were so many of these strange items that Butler was called to the Treasury to look over the accounts with the officials. One New Orleans item objected to was "Banquet, Post-Office to St. Charles Hotel-\$400."

"Now," said the official, "it's all right, Gen. Butler, for you to give as many banquets as you please, but I don't see how, in justice, you could ask Uncle Sam to pay \$400 for a supper which you choose to give to the postmaster at New Orleans at the St. Charles Hotel there. "O," said Gen. Butler, with a laugh,

'that item is easily explained. 'Banquet' is the New Orleans name for street, and that \$400 was spent for fixing the street between the Post-Office and St. Charles Hotel.

After the laughter over this item had subsided the Treasury official said: "Weli, Gen. Butler, I have no doubt these accounts are all right, and if you will explain satisfactorily one other item I will pass them. Here is a charge of \$50 for a hand-organ and a monkey. Now what possible use a hand-organ and a monkey would be to the United States government, or to you as its General, I cannot see.'

Gen. Butler then told the following: "I can also explain that hand-organand-monkey item. It was the hottest time of my campaign about Baltimore. The rebels were very close-mouthed, and I could get no inside news of the doings of the rebels. One day I saw a great crowd gathering around a man with a hand-organ who had a very large 13. 1886-194th Monthly Drawing monkey. As I drew near I noticed that the man playing the organ looked very much like a smart Irishman whom I axis in less than ten hours. From the had among my soldiers. I said nothing. small density (1.38) of Jupiter we should but went back to my headquarters, and calling up the Irishman, in whom I had part at least, of fluid or gaseous matter perfect confidence, I gave him some not yet cooled sufficiently to form solid money and told him to go and buy out the musician. He did so. He bought the hand-organ, the monkey, and the musician's clothes, and paid \$50 for them. Dressed in these I sent him out as a spy. He traveled all the surrounding country and gave me some very valuable information. This information was worth thousands of dollars to the United States government, and, concluded Gen. Butler, "you can thus see why it paid the United States to pay \$50 for a hand-organ and a monkey." Washington Letter to Cleveland Leader.
