

THE ALAMANCE GLEANER.

Vol. XXIII.

GRAHAM, N. C., THURSDAY, DECEMBER 30, 1897

NO. 47.

Rich Red

Col. Olds has discovered the best breeder in North Carolina, and writes to the Messenger:

A man writes to the adjutant general here that he captured at Saylor's Creek the flag of the Twenty-first, North Carolina regiment, and the remnant of that regiment, also parts of two other regiments, that his regiment came up and that he had to turn over his prisoners, some 100 men, but kept the flag of the Twenty-first. He wants to correspond with some of the Twenty-first. This letter writer lives at Walls Walls, and is the banner preparator of this decade.

Blood

That burning sensation in the stomach, the pains and suffering which I experienced for five long years, brought on by continued constipation and indigestion, are almost indescribable. I tried every known remedy without effect. Finally I tried Ramon's Liver Pills & Tonic Pellets, following the directions carefully. After taking a few doses I began to improve. I have not used more than three boxes and feel as well as I ever felt. My restoration to perfect health I attribute solely to the use of Ramon's Liver Pills & Tonic Pellets, and I only wish I could persuade others to do as I did, and be cured. Logan M. Niles, Amsterdam, Va. For sale by J. C. Simmons.

SELECTION OF BREED.

The Plymouth Rock (See Above) is the best for all purposes.

If it is decided to keep but one breed for all purposes, the Plymouth Rock will fill the bill with more satisfaction than any other breed. Good layers, good mothers and good table birds, they combine all the money making qualities. They are hardy, naturally healthy, easily kept, good foragers and equally happy in confinement or on range. Besides, they are the universally popular breed. They are better known, more generally kept and more appreciated than any other breed. This makes them an additional source of profit, as it is never a great effort to sell them. The demand for them has never diminished since their introduction to the American public. On the contrary, they have made a strong progressive march into public favor, and today they are more sought for than any other variety.

An utility fowl they are placed at the top of the list, and as show birds they are usually the most important breed in the exhibition hall.

Now, if the beginner has settled on the Plymouth Rock, it becomes necessary that he proceed at once to study their nature. In the first place, they, like all other breeds, should have comfortable quarters. It is poor economy to house any fowls in stables, garages, sheds, or any other place where they will be subjected to a draft of cold air. They should be kept perfectly dry and free from dampness, therefore a slight rise of ground which constitutes natural drainage is the best site. The front should face the south or southeast, thus to catch the warm sun in winter. Windows sufficiently large to admit plenty of light, but not too large, are very important.

The second consideration should be food. As the Plymouth Rock is a heavy breed, somewhat slower in their movements than the sprightly Leghorns, for example, they can be very easily overfed. To guard against this tendency they should be kept comparatively hungry, in order to induce them to scratch and hunt for other words, to exercise.

It pays best to give them this exercise outdoors at all seasons of the year. The best time for this is in the morning, if snow is on the ground, it should be swept away a certain distance in their time that they may take advantage of the outer air and not be continually confined to their coops. They are a well feathered breed and can stand any quantity of cold weather.

If the breeding stock is cared for thus with a view of maintaining strong, healthy, vigorous specimens, the eggs will be found to hatch well and the chicks will live when hatched and thrive accordingly. As like breeds that we cannot expect strong chicks from weak and debilitated stock.

Whether one uses the natural or artificial method of hatching matters not, provided he understands the system he adopts. There is quite as much for the beginner to learn of the one as of the other. The idea that he can do it all in one's own mind is a mistake. It is not a safe one. Eggs must be properly set and properly cared for if a good hatch is desired. The Plymouth Rocks are excellent mothers, but they can become as unsatisfactory as any other breed if not thoroughly understood.

The young stock should have, however, in either case, plenty of range to induce growth and development. The old stock to which later, generally and profusely, the weather is best for doing it. Early eggs in November command a high market price, and it will thus pay well to make your pullets producers at once. A free use of raw meat three times a week will be found a great help in inducing early maturity. This, however, must not be used until the stock is two-thirds grown and after the bugs, choppers, etc., have become scarce. If green food is used in September, it should be supplied, as it is very necessary, being the natural food of all poultry.

The keeping and raising of poultry, if success is desired, are not what may be considered easy. It requires first a love for the pursuit and then a natural inclination to study and learn by personal experience how success may be attained.

Ignorance and carelessness cost a great deal of time and money, yet experience is the best teacher. What one brooder does is no criterion of what another can do. Still the advice of a successful breeder is a great help to the beginner if he will follow it. The Plymouth Rock is a very hardy breed and will stand almost any weather probably better than any other variety, and there is no breed that will turn in a better record for good calls and proper handling.

Poultry Notes.

A little draft in the henhouse often causes roup.

A little attention to a droopy foot will save it.

Little drafts will often begeth to scaldable breeds cholera.

A little attention to the whole flock will keep them in condition.

A little manner to the henhouse will add to a little of the day's production.

FARM GARDEN

PLOWS AND PLOWING.

Three Conditions to be met For Good and Seasonable Work.

Having secured a good plow and team, a writer for the Ohio Farmer advises you to proceed as follows: His remarks at first concern walking plows:

If there is a difference in the height of the horses, hitch them so the taller one will walk in the furrow. Use a doubletree about three feet long, so as to allow the horses to walk close together. The legs of traces should be capable of being lengthened and shortened. After the team is "hooked up" there are three conditions to be met—first, the plow must run the desired depth; second, it must run level and steady; third, it must be of as light draft as possible.

If there is some point in the plow that is the center of resistance. Call that point "A" (Fig. 1); also there is a point about which the power is applied. Call this "B." In the conditions under consideration this point is midway between the upper ends of the two inside traces (see E, Fig. 1) where they join the harness. Let this point be "B" (Fig. 1). Since there is a flexible connection between these two points (A and B, Fig. 1)—that is, there is a joint or swivel at the clevis—this trace, the doubletree and the points A and B will be in the same straight line, as shown by A, C, B, Fig. 1.

Suppose we have our clevis too high, as at D, then the points A, E, D are not in the same straight line, but D is above C. Now, as soon as we start the team the pull on the trace will tend to bring the points A, D, E into a straight line—that is, bring the point D down to C, thereby depressing the end of the beam.

Suppose we have our clevis too low, as at F, then the points A, E, F are not in the same straight line, but F is below C. Now, as soon as we start the team the pull on the trace will tend to bring the points A, F, E into a straight line—that is, bring the point F up to C, thereby depressing the end of the beam.

Suppose we have our clevis just right, as at G, then the points A, E, G are in the same straight line, and the team will pull in the desired direction.

Suppose we have our clevis just right, as at G, then the points A, E, G are in the same straight line, and the team will pull in the desired direction.

Suppose we have our clevis just right, as at G, then the points A, E, G are in the same straight line, and the team will pull in the desired direction.

Suppose we have our clevis just right, as at G, then the points A, E, G are in the same straight line, and the team will pull in the desired direction.

Suppose we have our clevis just right, as at G, then the points A, E, G are in the same straight line, and the team will pull in the desired direction.

Suppose we have our clevis just right, as at G, then the points A, E, G are in the same straight line, and the team will pull in the desired direction.

Suppose we have our clevis just right, as at G, then the points A, E, G are in the same straight line, and the team will pull in the desired direction.

ORIGIN OF LACE.

Discovered by a European Woman as Early as the Sixteenth Century.

In an interesting article on the subject of "Lace" in The Woman's Home Companion Oriens L. Shackford, after giving the history of machine made lace, goes on to say:

"Handmade lace has a history far more fascinating. Some have supposed that it originated in Egypt, the land that gave birth to nearly all the arts, but search diligently as you may and you will never discover in mummy's tomb, on sculptured or
