One Man's Scheme,

An enterprising young man has di

covered a plan for making a living that is absolutely original. He has

rented rooms in a down town building.

In these rooms are lockers, dressing rooms, a barber shop, bathrooms and a bootblack stand. The establishment

is intended for the convenience of busi-

ness men who are in a hurry to keep

evening engagements. The idea is to have the business man send his dress

suit to the enterprising young man in the morning. The E. Y. M. presses,

cleans and repairs the clothes and

hange them up in a locker.

Late in the afternoon the busine

man in a hurry rushes in, takes a

bath, a shave and a shine; thrusts him-

self into his dress suit, throws his business suft into the locker and is off

to Brooklyn, Hoboken or Boston to

keep an engagement with the least

possible loss of time. After he is gone the E. Y. M. gathers up the everyday

clothes of the business man in a hurry

and sends them to his home, ready for

him to repeat the process on the fol

SILO BUILDING. How to Mount the Frame and Set Up

In the course of a series of articles on siles and ensilage in the Ohio Farmer John Gould gives concise and clear directions for building the now popular

round silo. He says: In setting up a stave silo it is neces sary to make a staging, so that it will nearly conform to the cylindrical form of the sile. To do this it is best to set four posts solid in the ground close to the outside of the sile and mount on this a frame, as shown in Fig. 1 of the first cut. This can be readily made of 16 feet boards, with the corner boards,

Make the inside measure of this frame just as large as the outside di-ameter of the silo will be, so that it

exposed. The question of silage becoming frozen is not much more discussed as it is found that the freezing is only slight in the most intense zero weather, and if soon fed out does not seem to be injured to any noticeable extent. The carrier to this silo fills into the top at R. When to Sow Buckwheat.

The old rule of delay the cowing touch the frame at eight points Start by tacking a stave to the frame, then add staves, toe nailing them on to the other at top and bottom with one nail at each end of the stave, and so on round. The platform should be at least 12 feet from the ground and staid so buckwheat until the 4th of July hardly a safe one to follow in northern states, where frost often nips this tenderest of all vegetables before its grain is perfected. There is, of course, dan-ger from too early sowing of this grain, exposing it to the severe heats which that it cannot twist or sway. The hoops conetimes prove as destructive as frosts, blasting the blossoms so that they do not set with grain. But if the buckwheat can be sown during the last can then be put on, and as they are tightened are pounded into place and trued up so that the inside surface shall be as true as possible. For hoops some think the seven-eighth of an inch rod with burns at both ends, days of June there is little danger that it will be blasted by the heat, and the ions from untimely frosts, which is the

INSURANCE

I wish to call the attention of insurers in Alamance county to the fact that the Burlington Insurance Agency, established in 1893 by the late firm of Tate & Albright, is still in the ring.

There is no insurance agency in North Carolina with better facilities for placing large lines of insurance, that can give lower rates or better indemnity. Only first-class companies, in every branch of the business, find a lodgement in my office. With a practical experience of more than ten years, I feel warranted in soliciting a share of the local patronage. I guarantee full satisfaction in every instance. Correspondence solicited upon all matters pertaining to insurance.

I am making a specialty of Life Insurance and will make it to the interest of all who desire protection for their families or their estates, or who wish to make absolutely safe and profitable investment, to confer with me before giving their applications to other agents,

Very respectfully,

A satisfactory clarification of the juice not only brightens the product very materially, but also effects the removal of a large proportion of the albuminous matters, whose presence favors the growth and action of ferments.

It is also of the greatest importance that more attention be given to the density to which the sirup has been cooked, since in most cases the sirup boiler determines by the eye and in a very crude way the point at which the sirup should be drawn off.

In many cases the sirup is cooked to too thick a consistency, and as a conse-quence a crystallization and deposition f sugar take place, while, on the other ind, if the sirup is not boiled to the proper density, fermentation is likely to eneue, and the preservation of the sirup becomes a more difficult problem. the ordinary form of evapo-tal thand, the actual process of evaluation of the conducted in the
