How Fishes Multiply. Piscatory authorities of the highest standard tell us that were it not for nature's grand "evening ap" provisions, the fishes of the seas would multiply so rapidly that within three short years they would fill the waters to such an extent that there would be no room for them to swim. A TREASURED COAT.

IT WAS SLASHED BY WILKES BOOTH WHILE RUNNING AWAY.

The Coat Was Worn by the Leader of the Orchestra the Night Lincoln Was Assassinated-A New Story About an Historic Tragedy.

William Withers, Jr., is the quiet man who leads the ochestra at the California theater, and when not marshaling his musicians is writing music in his room at the Brooklyn hotel. He is so retiring that few can claim to know him well, although his musical genius has for thirty-five years given him standing among the composers and leaders of

Mr. Withers is fifty-five years old now, yet looks to be not more than forty, and would appear even younger except for an episode that occurred on the evening of April 14, 1865, at Ford's theater in Washington. That evening Withers almost had the unpleasant distinction of being murdered by Wilkes Booth after the latter had fired the fatal shot at President Lincoln and was rushing madly from the stage to an entrance where a confederate had a horse in waiting.

Mr. Withers' most valued treasure is A clergyman in Maine, who lives near a dress coat, now in part destroyed by the moth that corrupts all wool, but on the back of the cost can be plainly seen ment, but which has also supplied him | two clean cut slits, made with a sharp edge. One, high up, as though a stroke for the wearer's neck, had missed it by a little and descended upon the garment. The other cut, nearly over the center of the space under which the wearer's right shoulder blade would be, is longer but equally well defined, and made with the same sharp steel.

Wilkes Booth made both these slits, manding a magnificent view of the broad | and the wonder is that his victim was not fatally slashed, instead of being only

The Formation of Heat.

. M. Lagrange has communicated to the Belgian academy a paper on the forms. Upon the Life and Character of the tion of bodies in the universe. In this paper he expresses the opinion that, be-fore any expenditure of work, the quantity of heat of the universe was nil, that the temperature was gradually raised above absolute zero at the expense of work done by attraction, and bence the formation of solid bodies must have preceded that of liquids and gases; that, through the gradual condensation of matter and consequent enormous development of heat, the earth would attain, at least in the parts near the surface, the state of fluidity necessary to its form and geological characters; then, as the temperature gradually rose with gradual agglomeration of matter, a very dense atmosphere would form, with pressure diminishing outward, and in a more advanced phase, the temperature of this, after reaching a maximum, would gradually diminish; causing liquefaction or solidification of certain matters at first vaporous, while other solid bodies might remain suspended in the atmosphere.

Briefly, M. Lagrange, in elucidation of the basis of his original and remarkable theory, as thus set forth, declares that space is occupied by two substances, namely: One, attractive, which is matter properly so called, or material atoms; the other, repulsive, which occupies the interatomic space, and from which results between any two atoms a variable repulsion exercised at the surface of the latter.—Philadelphia Ledger.
