### LOCAL FEED MAN AT TENDS SALES CLASS

#### Spends One Week At Purina School In Charlotte, N. C. Studying Animal Nutrition and Better Feeding Methods

Mr. L. O. Tharrington of the Spot Cash Co., of this city has just returned from Charlotte where he attended the Purina Mills Sales School held last week at the Selwyn Hotel. "In this class," says Mr. Tharrington, "every phase of livestock feeding was studied, with a view of enabling salesmen and local feed dealers to render a higher class service to feeders of live stock. "I was very much impressed," says Mr. Tharrington, "by the figures presented showing the value of the live stock and dairy products sold annually in our county. According to the figures compiled by the United States Department of Agriculture, Franklin county farmers sell every year \$300,000 worth of poultry products. Figures showing the value of hogs and steers are equally impressive. "Big as these figures are, it is possible," says Mr. Tharrington, "to increase the value of these products sold in Franklin county by one-fourth to one-third by the introduction of proper feeding methods among the farmers generally. This extra production will create extra wealth which would be used in part to buy building material to make improvements, to buy automobiles, more clothing, furniture, etc. In other words better feeding will tend to increase proportionately the business done by every firm in the county. "The interesting thing," adds Mr. Tharrington, "is that it takes only a comparatively small increase in production to double the farmer's net profit. According to a survey made by Hoard's Dairyman, one of the leading dairy publications, an increase of only 10 per cent in the amount of milk produced will frequently result in doubled profit. "Take for example the case of a cow producing 20 pounds of milk a day, 18 pounds of which is required to pay for the labor, feed cost and miscellaneous expense. This leaves two pounds net profit. This same cow can be made to produce 22 pounds of milk a day, or two extra pounds (10 per cent more)—four pounds profit instead of two, or double the net profit. On that basis just one extra inch of milk in the pail is worth from \$16 to \$40 more on the ton of feed. The same thing holds true with other live stock and poultry. It is vitally important that the feeder get those few extra eggs, that extra milk, or the fraction of a pound extra daily gain in producing pork beef. "At the start of the course," says Mr. Tharrington, "the importance of agriculture in the economic life of America was emphasized. It was shown that the annual output of all farm products greatly exceeds the annual production of iron ore, farm machinery, automobiles, coal, and the earnings of the railroads combined. It was pointed out that in view of the magnitude of the farm industry, greater efficiency in farm operation and a better knowledge of operating cost is highly desirable. "To give a foundation for correct feeding methods, the principles of animal nutrition were carefully studied in the school. In this session were developed the fundamental reasons for balanced rations—to supply elements required by the animal for a variety of purposes—maintaining the body, replacing worn out tissues, building bone, supplying heat and energy, and making milk or eggs. Weeding out poor stock breeding for vigor and feeding for results, is the combination that spells profits for the farmer. "Another point frequently overlooked by dairymen, is the necessity of feeding a dairy cow a concentrate ration that contains the proper amount and quality of protein. It is true that a cow will produce almost as much milk for the first few weeks, without a high protein concentrate. But she does so at the expense of her body and that means a sure cut in the milk supply later on. "The cow with her mother instinct to produce milk to nourish her offspring, produces a good volume for a few weeks, drawing on her body for the nutrients her improperly balanced feed lacks. But then nature calls a halt. The cow, run down physically, must start to rebuild her body, and the milk flow gradually decreases. Once a cow falls off in her milk, it is almost impossible to bring her back before she freshens again. "So too in the matter of eggs. The average United States hen lays 72 eggs a year; the average Purina fed hen lays 148 eggs a year. This tremendous increase is brought about because a balanced ration supplies materials for making approximately an equal number of yolks and whites, while a grain ration develops more yolks than whites. As no hen can lay half an egg, the extra yolks are absorbed into the body and egg production is cut down. "All who attended the school were thoroughly drilled in the most up-to-date methods of culling poultry—of weeding out non-producing 'boarder' hens. The results of culling by the system taught have been carefully checked time and again by experiment stations and on practical poultry farms in all sections. Birds have been culled out as non-producers and shut off to themselves for twenty to thirty days. In spite of generous feeding they did not produce an egg, proving conclusively that the system is reliable. "Proper feeding of brood sows is especially important right now if the hog raiser is to make any money. The feeder's profits depend very largely upon the size of the litter. Today the average farmer loses before weaning time, forty per cent of the pigs farrowed. This represents a tremendous loss to every community. According to the experience of hog feeders everywhere, properly balanced feed pro-
