Pineapple Finger Cake

When summer weather invites you to outdoor meals, plan foods that are fun, easy-to-eat and simple-to-prepare (with a minimum of utensils left for the dishwasher)! Pineapple Finger Cake fills the bill perfectly - a scrumptious flavor combination of crushed pineapple and chopped nuts.

This loaf cake sprinkled with confectioners sugar can be

safely carried from oven to anywhere. Another time and mind-saver is enriched self-rising flour. There's no mixing or measuring because the miller has already blended in correct amount of leavening and salt.

No matter where Pineapple Finger Cake is served, your family will benefit from the essential B-vitamins, thiamine, niacin and riboflavin, plus the minerals iron and calcium preblended into the enriched self-rising flour.

PINEAPPLE FINGER CAKE 12 to 15 servings

I cup sugar

1 can (1 lb. 4 oz.) crushed pineapple, well-drained

1 cup chopped nuts 2 cups enriched self-rising

Confectioners sugar

Beat eggs until fluffy and lemon-colored. Gradually blend in sugar until mixture is thick and light in color. Stir in pineapple and nuts. Gradually mix in flour. Turn into greased 9 x 13-inch cake pan. Bake in preheated 350° oven 25 to 30 minutes, or until done. Cool in pan completely. Dust lightly with confectioners sugar.

*Spoon flour into dry measuring cup: level. Do not scoop.

COMPLETE LAWN & GARDEN CENTER

Garden Time

By M. E. Gardner, Dept. of Horticultural Science N. C. State University

I found a sasanqua cam-ellia today heavily infected with the azalea and camellia leaf and bud gall disease.

This is a fungus which causes the leaves to become thickened, curled, fleshy and pale green to white in color (sometimes pinkish). Flower parts may also be affected, especially the petals of rhodo dendron. Under average home conditions, the disease is more alarming than serious because of the unsightly appearance.

All you can do now is hand pick the affected parts and destroy them, preferably by burning. Sometimes, during humid weather in early spring, this disease may be come troublesome enough to require spraying. If it does, spray with Bordeaux mixture

beginning near the end of the flowering period, and every two weeks until mid-June. Bordeaux may be purchased in powdered form and mixed with water according to instructions.

Lace bugs are active and should be controlled without delay. This insect is serious on many plants, especially azales, pyracantha, Washington hawthorne and rhododendron in the mountains. Adults are about one-eighth inch long and have lace-like wings with brown and black markings.

To control this pest, spray thoroughly the underside of the leaves with malathion. Use eight teaspoons of 25 percent wettable powder to one gallon of water. Spray at 10-day intervals until the in-sects have been completely controlled. This spray is a double-barreled control because it will also take care of

spider mites on azalea and the other plants mentioned. Dust may be used but it is not as effective as spray and must be applied more frequently.

If you permit these pests to get the upper hand, they can give your plats no end of trouble. They suck the juices from the leaves, causing them to become discolored and seriously interfering with the manufacture of food so necessary for normal plant

Dust young pepper, to mato, radish, beets, etc., with Sevin to control flea beetles. This small black insect, resembling the common flea, eats holes in the leaves and can be very destructive unless controlled. There are other materials which may be used but Sevin is usually effective, and safe to use.

Improving the individual remains the cardinal purpose

Plan Now For Your Iris Planting

about iris again for they can be planted from July until late in the fall. If you are planning on ordering any new iris this year make your list now while they're in bloom and get your order in. In this way you will be sure of get-ting the first choice of the rhizomes and the desired colors.

Your iris may be planted as soon as they arrive, providing you avoid planting them during the heat of the day. If you are not going to plant the rhizomes as soon as they arrive open the package at once and spread the roots in a cool, dry place.

In a light soil plant the rhizome just under the surface of the ground in a hole large enough to allow the full spread of the roots. The top of the new iris should be a little above the level of the ground. The soil should be

Pack the soil firmly around each rhizome

Since your new plant is planted very close to the top of the ground, cultivate very shallowly and very carefully. Clean cultivation is a must as iris like strong sunlight. Keep all dead leaves and weeds away from the plant.

After you have planted your iris they should be kept damp until the root system has become established. Iris does not require a great deal of water after this.

Use non-acid forming fer-tilizer. Steamed bone meal

"Ih times of trial," boomed the visiting pastor, "what brings us the greatest com-fort?"

From the rear of the church came the answer: "An acquittal."

CARTOP CARRIER

We also have in stock a complete line of complimentary prefinished moulding.

HOW TO MEASURE A ROOM FOR PANELING!

1.) Figure the perimeter of the room.
2.) Convert perimeter to number of panels needed. See conversion table at right. Example has 66ft. Our table shows you will need 17 panels. This is figured on 8ft. high ceil—3.) Deduct for areas such as doors, windows, etc. For estimating purposes deduct 2/3 panel for door, 1/2 panel for

 Subtract total deductions from number of panels figured. Round off to next highest number. Example shows 17 panels less 3½ panels for doors, windows and a fireplace This leaves us with 13½ panels — round out to 14 panels. CONVERSION TABLE Panels needed
