Study Your

Lighting Effects Electrical engineers and architects have developed a science of lighting in an effort to give better types of lighting to offices, factories, stores and home. Homemakers would do well to study the various kinds of lights and how they can be used to make the home more attractive and healthful

There are three types of direct, indirect, and

semi-direct.

Direct light is obtained from floor or table lamps which throw light up and reflect it down throughout the room and from indirect floor lamps which do the same thing. Indirect light is also obtained from cove lighting which is built into a room

at the ceiling line. Semi-indirect light is obtained with lamps that have diffusing bowls. In this case more than fifty per cent of

the light goes up.
Decorators say that every room should have indirect light for general illumination from a switch at the entrance of the room, direct light for reading and semi-indirect light for beauty.

The direct lamp used for reading should be high enough to throw light on the book. A good height for this kind of lamp is about thirty inches.

Use semi-indirect light in table lamps for a pleasant "conversational" light. The style today in table lamps is than in the past. Small squatty lamps look old fashioned.
