

" May your rich soil,

Improvement in Selecting Seed Wheat.

In the selection of seed-wheat, take at east six bushels of a good quality, then uke a seive or screen with holes sufficently large, so that 5 bushels of the B will pass through it. The one bushel that remains will be kernels of the largest site, and this should be used for seed. When this seed is sown and germinates, z will be found that the blades which spring from it will be uniform, and present the same healthy appearance, and will maintain the same equality until the time of harvesting. Thus instead of having so great a proportion of small weakly stocks start from diseased or pinched kernels, which can never produce any thing but small straw and consequently wheat of an inferior quality, the whole will stand a fair chance to come to matunty, divested of many evils which attend the sowing of grain where sifting to neg mercy -look on me!" lected.

But, says the reader, this important disthat will result trom this discovery and

of this town, tried the experiment the past season, and the result was what we had good reason to expect, the most perfect growth of wheat he has ever raised. I blieve if this practice should be adopted geat an extreme. The improvement is within the reach of every farmer; and be can satisfy himself on this point.

Maine Farmer.

SPILIN-We see many borses that have a disease in the gambrel joint, called spavin. It stiffens the joint and reuders them lame until, after having been in motion a little while, the parts become by any operation, except occasionally applying something externally, which is to the ordinary drudgery of a farm. We have seen a species of spavin that consisted in what surgeons call a varieose rein, that is, the coats of the vein in that
