breath.

"The famous wall in Rowan is a natural phenomeuon, common in the north; though fifty or more years ago, it was regarded as an artificial work; and in old books, great distances for specimens of the rock. The fragments were boxed up and sent abroad. A man once, it is said, dug a week across the width of it to find the in geology is called a dike, a word that signifies a wall. Braude says, "when a mass of unstratified or igneous rock, such as granite, trap, or lava, appears as if injected into rents and fissures in the stratified rock so as to intersect the strata, it is called a dyke." They vary in thickness from a few inches to 20 or 30 yards. they are composed of what is called greenstone, or basalt, or from their breaking up into regular shaped fragments, trap rocks; from a Swedish word trappa, a stairs. "Sometimes, when the melted matter,

thrown up from below to fill the crevice, cooled, it formed regular prisms, of 3, 4, 5 sides, &c., as in Giants' Causeway in Ireland. Generally these columns stand perpendicular; but in some places about Lake Superior, they are found lying on each other, with their smooth ends even. on the side of the wall, as if pieces of timber or fire wood had been sawed off, exactly of the same length; and then piled up regular. When the earth is removed, and the ends are exposed to view, they become an interesting natural phenomenon. All these operations show an effort of nature at crystallization on a large scale. We wish that those who visit this locality would take a compass and mark the direction of the wall: whether there is in this respect any relation to the Blue

whether the outcropping in different places lie in the same line : would a line drawn in the direction of one, strike another: be men and begin to act with those who when it runs through another rock, how is the latter affected by it: how related to the bed of granite in the vicinity that contains the trim crystals of felspar: any

which feed on the decaying bark. In these cases, says the Gardener's Monthly, a wash of weak lye or of lime water is very useful; indeed, where the bark is healthy, it is beneficial thus to wash trees, as many eggs of insects are thereby destroyed. We would, however, again refer to linseed oil as a wash, as far more effective for insects, and it would, perhaps, do as well for moss and lichens. After all, these seldom come when trees are well cultivated. It is neglect that makes poor growth, and it is poor growth that makes lichens.
