Successive Crops of Poultry.

Where labor is not too costly, or where, as in a large family, no account ts made of the labor of children, it is possible to obtain a large income from comparatively small fleck of fowls, This is accomplished by raising successive crops of chickens during the season. The first crop should be out of the shell by Feb. 1, and the last instalment by June 15. We are speaking now of raising chickens for the market by the first of May, and the last by Thanksgiving. The old fowls should be disposed of in July, or as soon as their services as layers and mothers. can be dispensed with. The success ive broods should be disposed of just as room as they will command a fair price. The earliest will be in marketble condition in from eight to twelve weeks. They can never be more profitably disposed of than at that age, for as they increase in size prices decline, and so the extra fool bestowed on them is actually thrown away.

By this method of promptly disposing of the chicks as they mature, the premises do not become overstocked and the soil of the runs foul, as is the case when large thocks are kept throughout the season to be sold at the the wrong side and then turned. Put holidays. By selling of the old stock it on when about to scour tins, in July the greatest possible profit is obtained from them. After this date they 'ny bat few eggs, begin to moult in the fall, and perhaps by not a sin- York letters to the san Francisco Argle egg before winter.
