How Many Meals for the Cow! It may seem a small matter to discuis, whether a dairy herd should be fed twice or three times a day, yet if twice is enough, as many believe, it is not so very small a matter. We have no doubt that instances could be cite 1 on either sile, which, taken alone, would seem to settle the question. If a cow is under-fed in two meals, or if her two meals are devoil of proper nourishment, even if full in quantity, the addition of a third feeding might increase her flow of milk or ad I to her weight of flesh. There is no doubt, whatever, that cows may be fed well, so they will do about all they are capable of doing by either two or three meals per day. We have practice I both systems and can hardly say that there is very much diff rence as far as the cow is concerned. She can take her food in two meals or in three, according to the convenience of the feeder and will do well either way if the fool is sufficient in quantity is that the development of flavor is and quality. But we have found it a conv nience to have our stock accustomed to the two-meal system. It is specially convenient in the winter season, when the days are short, and the pattle are taking but little exercise. In a very cold barn, possibly, cattle might need to be eating most of the time to get food enough to keep warm, Lut dairymen have no use for cold barns for their cows. Our stables should be so warm that no excessive amount of hay and grain will be require 1 for maintaining animal heat. Two feedings per day give the farmer the whole of the middle of the day for such employment as he may choose. He

can go to the woods and stay till the sun gets low, or he can drive a few miles to attend the grange, or visit friends, without feeling that he is neglecting his cattle.

from that of the horse. It is made to disputes. He accordingly had one aphold a large quantity of coarse, partially pointed who willingly undertook to dismasticated food that can be remasticated at leisure. For about twenty years Tumlin met the Indian justice and we have been feeding cattle but two full wanted to know how he was maintainmeals per day winter or summer, when ing the dignity of the law; the old Inconfined to the barn, and we are fully dian replied that he was doing finely, satisfied that two meals for average but had tried but one case. dairy stock are fully as acceptable to the cow and fully as profitable to the Tumlin owner as three meals. We are also satisfied that when cattle are fed late in the morning, as most are in the winter season, two meals are better than three. A cow that finishes her breakfast at eight o'clock has no very sharp appetite for dinner in four hours, and in many cases the noon meal is more of a disturber of remastication and digestion than a benefit to the animal. We were surprised to see how quickly cows would adapt themselves to the two-meal system, and would lie and shew the cud at noon when per-

Oil, says the American Agriculturist is fatal to every insect it touches, and sulphur is very off asive to them. A mixture of four ounces of lard and one of suphur, will rubled together, and with the addition of one ounce of kerosene oil and one drachm of creosote, will be found an excellent remedy against all sorts of insect vermin, while the liberal use of kerosene oil on poultry roots will free the fowls of their tormentor .

When the Danes want a butter that fresh, or one that will suit either the home or the English market, the cream is allowed to stand twenty four hours and to become slightly sour. Thus it controlled by controlling the changes in the milk and cream before churning. This is because of the fact that the dedescending. velopment or change is very rapid in the milk or cream, and comparatively slow in the butter; the rapidity of change in both cases being aff cted by the care of the milk and the method of manufacturing the butter.

## Indian Justice.

In the early history of this country, Appalachee was for a time the dividing line between the whites and the Cherokees. There was constant trouble between the two races that required friendly adjudication to prevent bloodshed; there was a justice on duty named Tumlin to whom these issues were generally submitted. II : soon got tired of the frivolous complaints of the Indians. and concluded that he would have an The cow has a very different stomach Indian justice and bailiff to settle their

pense justice. Some time after ward "What was your decision?' inquired

"I sentenced the plaintiff to receive fifty lashes and the defendant fifty, and made the bailiff pay the cost." cle. "Do you think that was right?" asked the white.

barometer at the centre of a cyclone or whirlwind. In the case of a great cyclone or hurricane, the direction of rotation is determined by the revolution of the earth about its axis, and the wellknown law of storms is founded on the fact that this rotation is, in the northern hemisphere, invariably against, and in the southern hemisphere with, the hands of a watch as you look at it when

laid down with the face up. In the case of tornadoes and waterspouts this direction of rotation is not so uniform, although the same law holds good in most cases. When a whirlwind is thus formed over the ocean water is often frawn up the centre of the whirl for some distance, owing to the suction created, and at the same time the moisture of the air is condensed as it rises. so that the name "waterspout" is very applicable. When a spout is forming, its upper portion is often visible first,

seeming to grow dow warl from the will possess a high flavor when it is clouds. By observing carefully with a telescope, however, it has been seen that the motion in the column itself is upward, although the moisture in the air which is rising is condensed lower and lower down, thus rendering the whirl visible lower down continually and making it appear to be actually That portion of the north Atlantic from the northern coast of Cuba to the

fortieth parallel, and from the Atlantic coast of the United States to the Bermudas, is pre-eminently a region where waterspouts are liable to occur owing largely to the warm, moist air which hangs over the Gulf stream and the cool, dry air brought over it by the northwesterly winds from off the coast.

The Number of Siberian Exiles. The chief paper of Ekaterinburg pubishes some interesting information alout the number of persons exiled from Russia to Siberia for political and other offenses. On January 1 of the present year the number of these prisoners of both sexes in the provinces of Irkutsk, Yenescisk and Yakutsk amounted to 110,000. Of this number 42,000 were in fixed places of residence, 20,000 were employed on different works, and 8,000 had escaped. In Western Siberia it appears the number of prisoners who "evade their custodians was still greater, for a census taken in the towns and villages showed that the enormous proportion of sixty-seven per cent. of the prisoners were missing. The paper throws no light on what become: of these unfortunates. - [Pittsburg Chroni-

He Acted. "Father," said Robert, 'I have long

and have at last decided, with your permission, to-"My son," interrupted the fond father, 'all the world's a stage. Take that hoe hanging in the woodshed, and go out and dig those potatoes back of the orchard.'

[Harper's Bazur.

A singular accident occurred in Susex, England. A fox huntress was out with the fox hounds, when her horse picked up a flint rock in his fore foot, and while galloping threw it back with such force against the shank of the hind leg that the bone was broken just bove the fetlock, and the animal had o be destroyed.

enst.

The death of Nathaniel Witherell at lens Falls, N. Y., recalls the singular coincidence that he was the thirteenth hild and the seventh son of his parents and the youngest child in the famiy, while Mrs. Witherell, who survives her husband, occupied the same relative osition in the family, being the thireenth and youngest child and the eventh daughter of her parents. They ad been married sixty-six years.

## Some Advantages of a Fruit-Diet,

"Fruit and fruit-culture, as related to ealth." was the subject of an address by Professor H. W. Parker before the owa State Horticultural society, in which working among fruit and living with it are commended to a population who become bilious on excess of ment. In temperate zones, the author says, 'the dire experience of almost universal lisease, and the evidence of those who have freely used fruit, point to this as a most needful article of diet; and when we come to the tropics we find that men must confine themselves mostly to fruitliet, a practice that should be largely followed in our long, hot summers; yes, with our present habits of unwholesome living, especially in respect to confined air and cooking, must be observed in winter as we'l. In the warm temperato climates there are nough examples of muscuar, long-lived people who live on a minimum of animal food, such as those of the Greeian Archipelago, who subsist on goats' milk, figs, and maize bread. Individual examples are to the same effect. Dr. Winship began as an invalid, and by athletics and diet attained such vigor that he could lift twelve hundred prunds. He indulged, we are told, occasionally in sardines, and for the rest depended on fruit and farinaceous (that is, starchy) food. The recovery of health in grape cures shows what may be sought in that direction; the peach cure has lately come into notice, and doubtless any ripe, fresh, juicy fruit, if not of a kind too astringent or laxative in certain cases, would do as well. I can testify that a quart or two of strawberries, twice or thrice a day, soon recovered me from torpidity of the liver and consequent constipation, increasing for a year or two; and yet this is spoken of as not of an aperient sort. Since then my only medicine is fruit the year round."-[Popular Sci-

ence Monthly. A Humiliating Position.
