#### Rails That Travel.

A St. Louis civil engineer, says the Globe-Democrat, says the rails on the St. Louis bridge were never stationary, but constantly crept to the east-that is, in the direction of the heaviest travel. The rate of progress, he said was about 260 feet in the year, or would be if the rails were permitted to creap as they pleased, which, of course, they are not permitted to do. It reminded him of a hill in southwest Missouri, over which a turnpike road was constructed, and, do what

they would, the people could not keep the road up and down the sides of that hill in good condition. The scores would excepto the bottom, and in six months the road would be as had as ever. They finally had to take up the gravel and macadam and replace them. with goods zed blocks of rough stone.
