Question: What causes weak ed breast bones in pullets? Answer: This condition caused by a lack of certain minerals and other elements in the feed and also by improper perch poles. A well balanced mash containing cod liver oil with both vitamin A and D will do much to correct the trouble. The use of perch poles with a flat top surface of 1 1/2 inches instead of the ordinary round poles will also aid in correcting the trouble. In addition to this the birds should receive oyster shell, succulent green feed, and plenty of sunshine.
