Housewives Are Told How To Outwit The Clothes Moth

"Those winter woollens you are putting away this spring are going to be more valuable than ever next fall," points out Miss Willie N. Hunter, clothing specialist of the N. C. State College Extension Service. War-time needs for wool emphasize the importance of protecting garments and blankets from moth damage," she declared.

Miss Hunter says that moths are likely to be in almost any house at any time of the year. "So eliminate all breeding places for moths," she advises, "and keep all floors and rugs well swept. Never leave wool rags or old wool clothes lying carelessly around the house. Don't let lint or hair accumulate in floor cracks or under baseboards—or dog or cat hairs remain in the basement. Moths like hair, feathers, and fur as well as wool."

Continuing, the Extension Specialist said: "Before you store wool garments, rid them of moths, larvae, or moth eggs. Dry cleaning, washing with a strong solution of neutral soap, or sunning, airing and brushing combined will kill moths—destroy their eggs and larvae.

"Put clothing away in paper bags, in paper packages, in boxes, or store in trunks, chests and tight closets. Seal all paper bundles, bags and boxes so the moths have no access. They won't eat through the paper, but they will crawl through the holes.

"For extra protection, use naphthalene or paradichlorobenzene, or moth balls which contain one or both of these chemicals. About one pound of flake naphthalene or paradichlorobenzene is a safe amount for a small chest, trunk or wooden box. For a large closet or storeroom, use a pound of crystals to every 100 cubic feet."

Farmers Eligible New Tires, Recaps

Farmers can qualify for new or recapped tires, providing they use their trucks or cars to haul produce to and from the market, Dean I. O. Schaub, director of the State College Extension Service, said in discussing the tire rationing system.

"The farmer who uses his truck exclusively to transport farm products and food to market, and to carry needed home supplies to the farm, is eligible for new tires and tubes," the agricultural leader explained. "This includes the transportation of fuel for farm machinery, fertilizers, and feeds to the farm. On the other hand, no new tires will be sold to farmers for trucks that are used to carry products to housewives or other ultimate consumers."

Dean Schaub said that the term "truck" includes pick-ups. Farmers are also eligible to get new tires for their tractors and other farm implements, providing they are not changing from steel wheels to rubber tires.

Turning next to the eligibility of farmers to receive recapped tires, the Extension Director said "Farmers who use their passenger cars to haul produce to and from market because they have no other practical means of transportation, are eligible to have tires recapped or to buy recapped tires. This eligibility also applies to farm workers and technicians who use their passenger cars to travel within and to and from farms essential to the war effort."

Dean Schaub said that farmers who use the trucks for important purposes other than those that make them eligible for new tires also may qualify for recaps. "For

instance," he stated, "a dairy farmer who delivers milk to consumers in an isolated area not having access to other sources of milk might establish eligibility if the local rationing board considers it vital."

Baby Calf's Ration Worries the Farmers

Thousands of North Carolina farm families are planning to raise an extra dairy calf this year, to help meet the Food-for-Victory goals in agriculture's war time job. F. R. Farnham, Extension Dairyman of N. C. State College, says feeding complications have arisen to worry some farmers.

The problem of supplying milk and butter for the family often forces the farmer to sell the young calf for veal at only a few weeks of age," Farnham explained, just because there is not enough milk for both the calf and the family."

The dairy specialist says that it is possible to raise a good calf when milk is scarce, if grains and cereal mixtures are balanced to partially take the place of milk. He emphasized that no substitute for milk should be used during

the first two weeks of the calf's life, during which time the calf should have about a gallon of milk daily. But after that, grains and cereal mixtures can be fed in place of part of the milk normally required in the ration.

It is also important, Farnham says, to keep a good supply of quality hay in a small rack where the calf will have access to it at all times after it reaches the age of two weeks. An ample supply of clean drinking water is likewise necessary. After the calf is about one month old, it is advisable to provide some type of grazing, such as a plot of temporary grasses consisting of a mixture of small grains, lespedeza or a good permanent pasture.

Farnham suggests that farmers having trouble with dairy calf feeding problems request Extension Circular No 177, either from their county agent's office or from the Agricultural Editor, State College Station, Raleigh. The publication is free.
