Tryon Boys' Club to Start Its Sixth Season's Work On Monday, June 17th

The Tryon Boys' Club will start work for this season on Monday, June 17th, under the leadership of Maj. W. A. Schilletter. All boys interested in joining the Club this summer are asked to come to the school building at 9:30 Monday morning.

The club was started six years ago under the leadership of Dr. George F. Taylor. It was planned and organized by Dr. Taylor who operated it in a highly efficient manner for a period of three years. Due to other duties it was necessary for Dr. Taylor to give up this part of his work. Mr. Schilletter has been in charge of the club for the past two summers. During the five years the club has accomplished wonderful results. The many fine features of the club are carried over in training into the future life of the Tryon boys.

The purposes of the club are to build strong character in our boys, encourage true sportsmanship and fair play in all games and activities, develop physically strong bodies, furnish amusements, and give training in handicraft work. During the last five summers the results accomplished have been wonderful.

Very careful attention and care will be given to each individual boy in character building (developing leadership, self control, responsibility and co-operation. Some of the leading citizens of Tryon have expressed their willingness and desire to help with this

Dr. Edgar Ballenger Wins Fame For Instrument

Dr. Edgar G. Ballenger, brother of C. W. Ballenger of Tryon and native of this city, who is already noted for his medical research work has made another great step in medical progress by his part in a new invention as described in the following clipping:

"A method for making color pictures of the inside of the human body—expected to be a step of great importance in modern surgery—has been perfected by three Atlanta physicians, it is announced in the current issue of The Southern Surgeon.

"The three physicians, Dr. Edgar G. Ballenger, Dr. Harold P. McDonald and Dr. Reese C. Coleman, explained in the article how they have adapted a miniature color camera to a cystoscope, one of the four types of telescopes used to explore the body's interiors, and had made color photographs of the inside of the bladder.

"It is thought possible the camera, made by an eastern firm, might eventually be adapted to instruments used for examination of the interior of the head, lungs and stomach.

"The new method makes it possible to peer into the body cavities through a series of lenses arranged in a flexible tube which has a tiny electric bulb on the end. It is also possible to perform delicate operations with long instruments which are thrust through the tube and manipulated with the aid of the light.

"The camera does not enter the body, only the periscope-looking
