Cataract.

The crystallino lens of the eye is situit, and Mrs. R. T. Marshall made it. The ated just behind the pupil, and lies between two fluids, the aqueous in front, Pasadona Sayslard says: It is conand the vitreous behind. Its object is to focus the rays of light which pass through the pupil upon the retina be gether in detachable sections, and all hind, where they act upon the terminal exqusitely polished by hand. It is an ends of the optic nerve and give vision. In ge as a cottage parlor organ-case bed- This lens seems to get its substance from stead; is as well made and as clabsrately the fluids in which it is immersed, and when disease of its structure occurs, it or amented as a fine piece of furniture probably arises from some lack of proper nutrition from these sources.

Perfect transparency of the lens is essential to good vision. When any portion of it becomes opaque, the entrance of light is obstructed or it casses through in an irrigular manner, and loss of vision more or less complete results. This condition of opaqueness constitutes what is known as a cataract. It may effect only a portion of the lens, or the whole may be so dense as to prevent the perception of any object, though it can never of itself be so complete as to shut off entirely the sensation of light.

Cataract may be congenital, or it may come on in youth or in adult life, but by far the majority of cases occur in persons over fifty years of age, in whom it takes the name of senile cataract. Generally there is found some embarrassment in the use of the eyes for a longer or shorter period before the opacity is visible to the eye.

The cloudiness usually has a definite starting-point, and from that place it may progress until the whole lens is involved, or it may be arrested spontaneously in any part of its course. Such cases of arrest have given rise to the belief that certain nostrums will prevent the formation of a cataract, or will remove it.

In reality no means is known of staying or preventing it. The only hope lies in removing the mechanical obstruction by surgical methods.

The form of cataract which follows an injury is explained by the fact that the capsule which surrounds the lons is rup tured, and a portion of the fluid enters experiments were fairly successful, the leps and produces a solden condition at one point, from which the disintegrathough not in every instance, and Herr tion may continue.

These seems to be a predisposition to the formation of cataract in some people, for in elderly persons, when one eya has become affected, the other is very likely to pass through the same experi-

ence While it is best, in order to get the most satisfactory result, to delay the opcration until the cataract is "ripe," that period being the time when it is most easily removed, one should never wait until the sight is entirely lost, for there is danger that the process may go so far as to render any operation entirely fruitless.
