While the production is probably equal to this figure, there is a good probability that not all of the lint will be picked. especially so if the weather is bad

after this date. Experience has shown that cotton crop yields can be forecasted fairly accurately by counting the bolls. This method has been followed rather closely for the past three seasons, in addition to the condition and yie'd estimates Then the data this year has been strengthened more than ever by the comparison of ginners' figures and estimates. Statistical methods to provide reliable forecasts of crops as well as of industrial probabilities.

While the reporters showed that the size of bolls were 92 per cent. of the usual size, a year ago they re-Preparation for the publication of ported 84 per cent. Thus this year's that while the estimates might be for 75 per cent, ginned, the actual ginnounced that the company would is nings computed for the same date at sue the Evening Appeal beginning De. the close of the season were about twelve points less than this. The per cent, picked has shown the same trend Thus by allowing a so-called spread or bias, the actual per cent gioned or picked can be closely approximated. In addition to the low price being

received for cotton staple, the price of \$1.02 per hundred weight being paid for picking seed cotton, which is the same as that paid a year ago, still further reduces the margin or net price of lint. It is estimated that 65 per cent. of the crop has been ginned and 75 per cent. has been picked.

The weather has been unusually favorable for harvesting the crop tais fall. The frosts and freezes bave done no great damage as the crop was already too large. The cold weather always interferes with the ease of picking but the absence of leaves makes lint. The forecasted estimate of ginnings to November 14th was
