

### EXPLANATION OF THE NEW CO-OP CONTRACT

#### Only One Crop Must Be Sold Through the Association As Signers Can Withdraw — Other Objectionable Features of Old Co-Op Plan Are Removed.

Danbury, Oct. 15.—Fourteen meetings of tobacco growers of Stokes county were held at the various high schools of Stokes county last week, at which County Agent J. E. Trevathan explained the new contract under which the tobacco growers of North Carolina are now organizing. There are some points of similarity between this contract and the contract which the farmers signed in the organization of the Tri-State Tobacco Growers' Association. However there are several of the more objectionable features removed in the new contract, which makes it much more attractive to the growers.

**Contract Binds For Only One Year.**

The new contract holds its members to sell only one crop through the association. If for any reason any member wishes to withdraw from the association, he can do so by filing notice to that effect with the management of the new association at any time during the month of April of any year. This makes it possible for any member to sell his part of the crop through the association for any one year, and to withdraw from the association at any time during the month of April of any year.

However no member can withdraw in the middle of any crop year. The only time provided for withdrawal being during the month of April of each year, said withdrawal taking effect on the first day of May following the notice by the withdrawing member.

**Self-Renewing Contract.**

If the member does not file a notice of withdrawal during the month of April then on the first day of the following May the contract automatically becomes binding for one more crop year. This makes it unnecessary for the satisfied members to sign a new contract each year. This makes the contract a permanent one but with an annual withdrawal privilege.

**Landlord Not Responsible For Tenants Share of Crop.**

With this contract the tenant on a member landlord's farm has the privilege of marketing his own part of the crop which he grows on the open market. However the tenant may sell his part of the crop through the association for any one year by filing with the association an agreement to that effect.

entered into between landlord and tenant. The landlord who is not a member may also sell his share of any one tenant's crop through the association in like manner, provided the tenant is a member of the association. It is assumed in this contract the landlord is only responsible for his share of the crop produced by each of his tenants.

#### Rights of Mortgage Holders Recognized.

If a time merchant or other person holds a mortgage against a member's crop the mortgage holder can file a claim with the association and insist upon the crop being sold upon the open market until such mortgage is satisfied. On the other hand the mortgage holder may give his consent to the tobacco going through the association, in which case the mortgage holder is paid his part and the balance goes to the grower.

#### Other Features Favorable To Grower.

There are several features in the contract and the proposed association which will be favorable to the tobacco growers. County Agent J. E. Trevathan announces that he will be glad to go to any community in Stokes county to explain the contract and also explain other things which the farmer should know before he joins the proposed association.

One thousand contracts have been distributed among the tobacco growers of Stokes county.

Farmers are requested to study the contract before signing. This the farmers are doing. Many farmers will hold back until they see those who failed to join the other Co-operating Association coming in to this one. This probably is not the correct attitude, however it is up to the fellow who did not join the other association to step forward and do his part in the organization of this association. The members of the old association are willing to do their part.

Los Angeles Chamber of Commerce claims that the census being taken will show its city fifth in population. It stood tenth in 1920.

By a newly developed process industrial alcohol can be manufactured from peanut shells.

### Browning Arms Co. Claims Wrongful Use of Name in Suits Against Two Mail Order Firms Selling Guns

The Browning Arms Company of Ogden, Utah, inventors of numerous automatic and repeating firearms, both sporting and military, including the Browning machine gun, has filed suit in the United States district court in Salt Lake against Montgomery Ward and company and Sears Roebuck and company, alleging wrongful use of the name "Browning" in advertising and selling automatic and repeating shotguns.

It is claimed that both Montgomery Ward and company and Sears Roebuck and company are now advertising and selling guns manufactured by Browning Arms company, but are misrepresenting to the buyer public that the guns are a product of the Browning company.

#### Want Profit Returned

It is asserted by the Browning Arms company that such procedure is prohibited on the registration and branding of the name "Browning" in the Browning business, and particularly that falling to the proprietor and distributor of its automatic shotguns, and the Browning company, to follow such methods constituted grounds for the profit on the sale of such shotguns as have been sold since the trademark in 1918.

The complaint charges that the defendants are now under license to sell their guns through the United States. The complaint states that both Montgomery Ward and company and Sears

Roebuck and company circulate catalogs of general merchandise in which, among other things, firearms are advertised, including Browning automatic shotguns, which are illustrated and designated, "The Genuine Browning Automatic Shotgun." It is alleged that Montgomery Ward and company also lists and illustrates a repeating shotgun which it calls the "Western Field," and that in the advertisements of the "Western Field Repeating Shotgun" Montgomery Ward and company prints conspicuously the word "Browning" as "Western Field Browning," and that the defendant also advertises an automatic shotgun which it designates "New Western Field Browning Design," the word "design" being printed in type so small as to be almost invisible.

#### Description Charged

The complaint charges that "the so-called Western Field guns are not made or authorized by the Browning Arms company and that the use of the name 'Browning' is calculated to and does represent to the public that such a gun comes from the plaintiff and is intended to be sold as so understood by the persons to whom the Montgomery Ward and company catalogs are sent."

The complaint against Sears Roebuck and company is similar, except it is stated that Sears Roebuck and company is advertising and selling a gun called the "Ranger" repeating shotgun with this description, "A Genuine Browning Model" and "Browning design."

Very distinct types of firearms have been invented by the Brownings, eight of which were used in the World war.

Korean and Kalle Ispedeva, Fredell county, has been inspected for certification by the North Carolina Crop Improvement Association.

After colling 395 inferior specimens from nine poultry flocks of Burke county, the remaining 1,371 hens were blood-tested for producing hatching eggs this winter.

**Better No Spinach For Them Than A Battle At Mealtime**

By E. V. McCollum, Ph.D., Sc.D.

Professor of Nutrition, Johns Hopkins University, Baltimore, Md.

Author of "The Modern Knowledge of Nutrition," etc.

The war is a time of war which neither disarmament nor peace treaties will ever affect. Its battles are fought in the nation's dining rooms by mothers seeking to make their children eat needed portions of spinach or other leafy vegetables.

This type of war deserves serious consideration. Its effects, while neither immediate nor fatal, are important to the future of the race. For they concern the physical and mental health of our children. And this kind of war must cease.

No child should ever be disciplined at mealtime because of the unwillingness to eat or digest it. Urging the child to eat something that he does not like produces a run of unpleasant emotion, which has an equally bad effect on the child's mind and physical health.

The child has learned the experience of eating spinach or other leafy vegetables as a result of an emotional state of mind. Fear, pain and anger have been his with the spinach and the mechanical functioning of the digestive tract.

The speaker who frequently urges to take a sip of water is motivated by the thought that the child is dry. It is dry because he is not at ease before his audience, especially if he is conscious that his debate, sermon, oration or lecture is not going smoothly to his credit. Under such conditions, the salivary glands do not produce much of a flow, saliva, the stomach and other digestive glands also are affected in a comparable manner. For digestion cannot proceed until the proper secretions are poured out.

#### Discipline Is Harmful

It is thus apparent that discipline at mealtime is not only ineffective but harmful. The most that should be done to cultivate a liking for necessary foods is to ask the child to taste these foods when they happen to be served to others. It should be explained that the foods in question are good for people, and that the child will later like them. Thus, no offense is given and no artificial distaste aroused.

Pronounced changes in tastes will often be brought about by this method in the course of a few months. But if the child is made unhappy by being compelled to eat a food which it does not like, the distaste for that particular food may become intensified rather than overcome later in life.

When the proper amounts of milk, eggs and meats are given to children the vitamin content of their diet is pretty well safeguarded. This is especially true if yellow vegetables such as carrots, tomatoes, sweet potatoes, etc., are included for their high vitamin A content. When the leafy vegetables are disliked, the cellulose content of the food may well be provided by including in the menu sufficient whole cereal foods to furnish indigestible cellulose. Whole wheat and rice furnish cellulose in more satisfactory forms

normal nutrition and where the chemical substances necessary to a complete diet are to be found.

Mothers, and especially American mothers, are taking advantage of this opportunity. They are applying the established facts of the modern science of nutrition to the rearing of their families. As an evidence of this, some future historians will note the fact that children and young men of this generation are happily long-lived. In describing their emotion he will point to the participation of spinach as a national characteristic of Americans required during the second and third decades of the twentieth century. He will almost certainly mention, as a result of this, the healthful resistance to certain infections, the prevention of cancer, and the increase in size and sturdiness of the first generation which had the good fortune to profit by the new discoveries about foods.

#### Vast Improvement in Diet

He will not fail to emphasize the perfection of processes in the canning industry. A part of the race's physical gain he will trace to this, because it made possible a vast improvement in the Nation's diet through the colder months of the year, by providing in wholesome condition a wider variety of foods than were ever before available to mankind in any part of the world. This promotion of healthful vigor he will contrast with the widespread illness of the past, and the need for "Spring medicines," "blood purifiers," and "Spring tonics" which were taken by nearly everyone a generation ago.

But knowledge of the modern science of foods is one thing and its application to the needs of children quite another. Every modern mother must therefore combine her knowledge of dietetics with some of the tact of a seasoned diplomat. With this equipment she should succeed in making her children eat sufficient quantities of all the kinds of foods necessary to health.

#### Leafy Vegetables Valuable

The leafy vegetables are of special value in furnishing indigestible material which serves as an intestinal regulator and promotes elimination. And this problem of intestinal hygiene is especially important now when so many of our foods are highly refined and contain little or no cellulose. Milk, meat or eggs are all so completely digestible that they leave little residues in the colon and hence are constipating.

As a first step, however, in the improvement of children's diet, the dining room wars must cease. They are quite as fruitless as any other wars. If a child is properly managed it will eventually acquire the dietary habits and likings normal to adults. It will appreciate the flavors of everything it should eat. And this ideal condition can never be reached through force, but only through tact and diplomacy.

E. V. McCollum

for the diet of children than do either corn or oats. Of these grains, the cellulose of rice is the softest and least irritating.

#### Prevents Bad Habits

If taken in sufficient amounts, the cellulose from these sources will serve admirably to promote dismissal of waste products with sufficient promptness to insure a hygienic condition of the colon. This will prevent the formation of bad habits which may eventually injure the large intestine in ways illustrated by the enormous numbers of persons in middle or later life who have subsisted too largely upon refined foods.

Parents of today have a greater opportunity than ever before to serve their children by helping them to lay the foundation for long and healthy lives. Our control over the physical basis of success in life is far more effective than ever before in human history. We know what the body requires for
